3. The transportSpecific field is checked for Default PTP over Ethernet (0b0000) or 802.1AS mode (0b1111) when enabled.

PTP packet generation

This section explains the format and content of the automatically generated PTP packets by the MAC when this mode is enabled. It provides the template of the common PTP message header, as well as the detailed description of the fields of the specific PTP packets generated.

Table 513. Common PTP message header fields

Bits								Octets	Offset
7	6	5	4	3	2	1	0		
transportSpecific				messageType				1	0
Reserved				versionPTP				1	1
messageLength								2	2
domainNumber								1	4
Reserved								1	5
flagField								2	6
correctionField								8	8
Reserved								4	16
sourcePortIdentity								10	20
sequenceId								2	30
sequenceId								2	30
controlField								1	32
logMessageInterval								1	33

PTP message header fields

- **messageType**

The following encoded values are used for PTP message types:

- SYNC: 0000
- Delay_Req: 0001
- Pdelay_Req: 0010
- Pdelay_Resp: 0011
- Delay_Resp: 1001

- **transportSpecific**

The following transport protocol encoding is used:

- Default PTP over Ethernet: 0000
- 802.1AS mode: 0001

- **versionPTP**

It is always set to 2 because PTP version 2 is supported.

- **domainNumber**

This field contains the value from the *PTP Offload control register (ETH_MACPOCR)*.

- **flagField**

The following values are used:

- alternateMasterFlag (Octet 0 bit 0): 0 for SYNC and Delay_Resp
- twoStepFlag (Octet 0 bit 1): 0 for SYNC and Pdelay_Resp
- unicastFlag (Octet 0 bit 2): 0 for Multicast Address, 1 for Unicast Address

- **correctionField**

For more information, see [Table 514](#).

- **sourcePortIdentity**

This field takes the value programmed in the *PTP Source Port Identity 0 Register (ETH_MACSPI0R)*, *PTP Source port identity 1 register (ETH_MACSPI1R)* and *PTP Source port identity 2 register (ETH_MACSPI2R)*.

- **sequenceId**

Pdelay_Resp and Delay_Resp use the same sequenceId field from received Pdelay_Req and Delay_Req PTP messages. For SYNC/Delay_Req, Pdelay_Req, a separate sequenceId counter is maintained. These sequenceId counters get incremented by 1 every time the corresponding message is generated and transmitted.

- **controlField**

The following encoded values are used for controlField:

- SYNC: 0000 0000
- Delay_Req: 0000 0001
- Pdelay_Req: 0000 0010
- Pdelay_Resp: 0000 0101
- Delay_Resp: 0000 0011

- **logMessageInterval**

- SYNC:

This field contains logSyncInterval from the corresponding MAC_Log_Message_Interval register.

- Delay_Resp:
This field contains the sum of DRSYNCR and logSyncInterval value taken from the [Log message interval register \(ETH_MACLMIR\)](#) for a multicast PTP message and 0111 1111 for unicast PTP message.
- Delay_Req, Pdelay_Req and Pdelay_Resp: 0111 1111
where logSyncInterval = log2 (Mean Value of Interval in seconds)

The MAC supports values of –15 to 15 for logSyncInterval fields, which translates to a range from 32.768 micro second (2^{-15}) to 215 second. For a given value of log sync interval (N), the time interval between two SYNC packets is given by the following:

- $2^{(30+N)}$ ns, when N is negative (–1 to –15)
- 2^N seconds, when N is positive (0 to 15)

For example:

- When logSyncInterval is programmed to 1, the interval is 2^1 ; therefore, the SYNC message is sent once every 2 seconds.
- When logSyncInterval is programmed to -1, the interval is $2^{-1} = 0.536$ seconds; therefore, the SYNC message is sent once every 536 milliseconds. The value is 0.536 seconds, because $2^{-30} = 1$ ns.
- When logSyncInterval is programmed to –5, the interval is $2^{-5} = 33.55$ ms; therefore, the SYNC message is sent once every 33.55 ms.

Note: The MAC uses the PTP system time to generate the intervals for periodic packet transmission. For negative values of log message interval programmed, the generated period may deviate from the value given by the equation $2^{(30+N)}$, because of the non-binary nature of the nanoseconds field of the system time.

PTP message-specific fields

The message-specific fields are the following:

- **messageLength**
There is no suffix supported, so this field contains the length of the PTP message that includes 34-byte PTP common header and the body specific to the message type.
For SYNC and Delay_Req packets, this field contains 44, whereas for Delay_Resp, Pdelay_Req and Pdelay_Resp, it contains 54.
- **originTimestamp**
This field is the captured egress timestamp for SYNC, Delay_Req, and Pdelay_Req PTP messages.
- **receiveTimestamp**
For Delay_Resp PTP message, this is the ingress timestamp of the corresponding received Delay_Req PTP message.
- **requestingPortIdentity**
For Delay_Resp and Pdelay_Resp PTP messages, this is the sourcePortIdentity field taken from the corresponding received Delay_Req and Pdelay_Req PTP messages.
- **requestReceiptTimestamp**
For the Pdelay_Resp PTP message, this field is set to 0.

One-step timestamp

The MAC supports the one-step timestamp feature that enables to identify the offset in the packet and inserts the timestamp received from the application at that offset.

MAC Transmit PTP mode for one-step timestamp

Depending upon the type of message and its mode, the MAC updates the following fields of Transmit PTP packets:

- correctionField in the PTP header of messages
- originTimestamp in SYNC, Delay_Req, and Pdelay_Req messages

Table 514 shows how the PTP mode is selected based on the settings of SNAP TYPSEL, TSMSTR ENA, and TSEVNT ENA bits of the *Timestamp control Register (ETH_MACTSCR)* and the fields that are updated for the incoming PTP packets based on the message type in that mode, during the one-step timestamping operation.

Table 514. MAC Transmit PTP mode and one-step timestamping operation

Programming			Mode	Per packet control ⁽¹⁾			Messages processed on transmission
SNAPTYP SEL	TSMSTR ENA	TSEVNT ENA		TTSE ⁽²⁾	OSTC ⁽³⁾	TTS ⁽⁴⁾	
X	X	X	N/A	1	X	X	Timestamp is captured and returned to application
X	X	X	N/A	X	0	X	OST operation is not performed (PTP packet is not modified)
00	X	0	End-to-end transparent	0	1	Ingress TS	Sync (correction field for residence time and Ingress asymmetric correction)
							Delay_Req (correction field for residence time and Egress asymmetric correction)
00	0	1	Ordinary or Boundary Slave	1	1	X	Delay_Req (originTimestamp field) Delay_Req (correction field for Egress asymmetric correction)
00	1	1	Ordinary or Boundary Master	0	1	X	Sync (originTimestamp field) Sync (correction field for subnanosecond correction)
01	X	0	End-to-end Transparent with support for peer delay mechanism	0	1	Ingress TS	Sync (correction field for residence time and Ingress asymmetric correction)
						Ingress TS	Pdelay_Req (correction field for residence time and Egress asymmetric correction)
						Ingress TS	Pdelay_Resp (correction field for residence time and Ingress asymmetric correction)

Table 514. MAC Transmit PTP mode and one-step timestamping operation (continued)

Programming			Mode	Per packet control ⁽¹⁾			Messages processed on transmission
SNAPTYP SEL	TSMSTR ENA	TSEVNT ENA		TTSE ⁽²⁾	OSTC ⁽³⁾	TTS ⁽⁴⁾	
01	0	1	Ordinary or Boundary Slave with support for peer delay mechanism or Peer-to-peer transparent	0	1	Ingress TS	Sync (correction field for residence time and Ingress asymmetric correction) (applicable only for Peer to Peer transparent clock operation)
				1	1	X	Delay_Req (originTimestamp field) Delay_Req (correction field for Egress asymmetric correction)
				1	1	X	Pdelay_Req (originTimestamp field) Pdelay_Req (correction field for Egress asymmetric correction)
				0	1	Ingress TS for Pdelay_Req	Pdelay_Resp (correction field for turnaround time and Ingress asymmetric correction)
01	1	1	Ordinary or Boundary Master with support for peer delay mechanism	0	1	X	Sync (originTimestamp field) Sync (correction field for subnanosecond correction)
				1	1	X	Pdelay_Req (originTimestamp field) Pdelay_Req (correction field for Egress asymmetric correction)
				0	1	Ingress TS for Pdelay_Req	Pdelay_Resp (correction field for turnaround time and Ingress asymmetric correction)
10	X	X	End-to-end transparent	0	1	Ingress TS	Sync (correction field for residence time and Ingress asymmetric correction)
						Ingress TS	Delay_Req (correction field for residence time and Egress asymmetric correction)

Table 514. MAC Transmit PTP mode and one-step timestamping operation (continued)

Programming			Mode	Per packet control ⁽¹⁾			Messages processed on transmission
SNAPTYP SEL	TSMSTR ENA	TSEVNT ENA		TTSE ⁽²⁾	OSTC ⁽³⁾	TTS ⁽⁴⁾	
11	X	X	Peer-to-peer transparent	0	1	Ingress TS	Sync (correction field for residence time and Ingress asymmetric correction)
				1	1	X	Pdelay_Req (originTimestamp field) Pdelay_Req (correction field for Egress asymmetric correction)
				0	1	Ingress TS for Pdelay_Req	Pdelay_Resp (correction field for turnaround time and Ingress asymmetric correction)

1. The per-packet control values provided here are the recommended settings used by devices in typical PTP operation and for the programmed mode.
2. TTSE represents TTSE bit of TDES2 transmit normal descriptor. The TTSE function is independent from the OST function and the programmed operation mode for OST. The MAC captures and returns the timestamp when the TTSE bit is set.
3. OSTC represents OSTC bit of TDES3 transmit context descriptor
4. TTS represents the timestamp value provided in the TTSH, TTSL fields of TDES0 and TDES1 transmit normal descriptor (write-back format).

Note: Residence time/ turnaround time is calculated as the difference between the captured timestamp (egress timestamp) and the ingress timestamp. Clocks supporting peer delay mechanism do not use delay request or response, but it is included in OST for flexibility.

Enabling one-step timestamp

The one-step timestamp feature can be enabled for a given packet by setting bit 20 (OSTC) in TDES3 context descriptor. To update the correction field in certain PTP packets, the ingress timestamp must be given in the TSSL and TSSH fields.

The one-step timestamp feature is supported only for the PTP over Ethernet packets. It is not supported for PTP over IPv4/IPv6 packets.

64.5.5 Checksum offload engine

Communication protocols such as TCP and UDP implement checksum fields, which help determine the integrity of data transmitted over a network. The most widespread use of Ethernet is to encapsulate TCP and UDP over IP datagrams. The MAC has a Checksum Offload Engine (COE) to support checksum calculation and insertion in the Transmit path, as well as error detection in the Receive path.

Transmit checksum offload engine

In the transmit path, the MAC calculates the checksum and inserts it in the Tx packet. This feature helps reducing the load on the software and can improve the overall system throughput.

The COE module supports two types of checksum calculation and insertion. The checksum engine can be controlled for each packet by setting the CIC bits (TDES3 bits[17:16]).

Note: *The checksum for TCP, UDP, or ICMP is calculated over a complete packet, and then inserted into its corresponding header field. Because of this requirement, the Tx FIFO automatically operates in the Store-and-forward mode even if the MAC is configured in Threshold (cut-through) mode.*

Make sure that the Tx FIFO is deep enough to store a complete packet before that packet is transferred to the MAC transmitter, the reason being that when space is not available to accept the programmed burst length of data, then the MTL Tx FIFO starts reading to avoid deadlock. In such a case, the COE fails as the start of the packet header is read out before the payload checksum can be calculated and inserted. Therefore, the checksum insertion must be enabled only in the packets that are less than the number of bytes, given by the following equation:

$$\text{Packet size} < \text{TxQSize} - (\text{PBL} + 5) \times 9$$

where

TxQSize corresponds to the TQS bitfield of *Tx queue i operating mode Register (ETH_MTLTXQiOMR)*

PBL corresponds to the TxPBL bitfield of *Channel i transmit control register (ETH_DMACiTXCR)*

Refer to IETF specifications RFC 791, RFC 793, RFC 768, RFC 792, RFC 2460, and RFC 4443 for IPv4, TCP, UDP, ICMP, IPv6, and ICMPv6 packet header specifications, respectively.

IP header checksum engine

In IPv4 datagrams, the integrity of the header fields is indicated by the 16-bit Header Checksum field (the eleventh and twelfth bytes of the IPv4 datagram). The COE detects an IPv4 datagram when the Type field of Ethernet packet has the value 0x0800 and the Version field of IP datagram has the value 0x4. The checksum field of the input packet is ignored during calculation and replaced with the calculated value.

Note: *IPv6 headers do not have a checksum field. Therefore, the COE does not modify the IPv6 header fields.*

The result of this IP header checksum calculation is indicated by the IP Header Error status bit in the Transmit status (bit 0 in *Table 536: TDES3 normal descriptor (write-back format)*).

This status bit is set whenever the values of the Ethernet Type field and the Version field of IP header are not consistent, or when the Ethernet packet does not have enough data, as

indicated by the IP header Length field. In other words, this bit is set when an IP header error is asserted under the following circumstances:

- For IPv4 datagrams:
 - The received Ethernet type is 0x0800, but the Version field of IP header is not equal to 0x4.
 - The IPv4 Header Length field indicates a value less than 0x5 (20 bytes).
 - The total packet length is less than the value given in the IPv4 Header Length field.
- For IPv6 datagrams:
 - The Ethernet type is 0x86DD but the IP header Version field is not equal to 0x6.
 - The packet ends before the IPv6 header (40 bytes) or extension header (as given in the corresponding Header Length field in an extension header) is completely received.

TCP/UDP/ICMP checksum engine

The TCP/UDP/ICMP Checksum Engine processes the IPv4 or IPv6 header (including extension headers) and determines whether the encapsulated payload is TCP, UDP, or ICMP. The checksum is calculated for the TCP, UDP, or ICMP payload and inserted into its corresponding field in the header. The Tx COE can work in the following two modes:

- The TCP, UDP, or ICMPv6 pseudo-header is not included in the checksum calculation and is assumed to be present in the Checksum field of the input packet. This engine includes the Checksum field in the checksum calculation, and then replaces the Checksum field with the final calculated checksum.
- The engine ignores the Checksum field, includes the TCP, UDP, or ICMPv6 pseudo-header data into the checksum calculation, and overwrites the checksum field with the final calculated value.

Note: For ICMP-over-IPv4 packets, the Checksum field in the ICMP packet must always be 0x0000 in both modes, because pseudo-headers are not defined for such packets. If it does not equal 0x0000, an incorrect checksum may be inserted into the packet.

The result of this operation is indicated by the Payload Checksum Error status bit in the Transmit Status vector (bit 12 in [Table 536: TDES3 normal descriptor \(write-back format\)](#)). This engine sets the Payload Checksum Error status bit when it detects that the packet has been forwarded to the MAC Transmitter engine in the store-and-forward mode without the end of packet (EOP) being written to the FIFO, or when the packet ends before the number of bytes indicated by the Payload Length field in the IP Header is received. When the packet is longer than the indicated payload length, the COE ignores them as stuff bytes, and no error is reported. When this engine detects the first type of error, it does not modify the TCP, UDP, or ICMP header. For the second error type, it still inserts the calculated checksum into the corresponding header field.

[Table 515](#) describes the functions supported by Transmit Checksum Offload engine based on the packet type. When the MAC does not insert the checksum, it is indicated as “No” in the table.

Note: Do not enable checksum insertion for IPv4 or IPv6 packets that are greater than the frame size constraint specified in [Section : Transmit checksum offload engine](#) because it might result in incorrect checksum insertion or unexpected behavior.

Table 515. Transmit checksum offload engine functions for different packet types

Packet type	Hardware IP header checksum insertion	Hardware TCP/UDP checksum insertion
Non-IPv4 or IPv6 packet	No	No
IPv4 packet is greater than 1,522 bytes (2,000 bytes when IEEE 802.3ad support for 2K packets is enabled in the MAC) but less than or equal to the frame size constraint specified in Section : Transmit checksum offload engine .	Yes	Yes
IPv6 packet is greater than 1,522 bytes (2,000 bytes when IEEE 802.3ad support for 2K packets is enabled in MAC) but less than or equal to the frame size constraint specified in Section : Transmit checksum offload engine .	Not applicable	Yes
IPv4 with TCP, UDP, or ICMP	Yes	Yes
IPv4 packet has IP options (IP header is longer than 20 bytes)	Yes	Yes
Packet is an IPv4 fragment	Yes	No
IPv6 packet with the following next header fields in main or extension headers: <ul style="list-style-type: none"> – Hop-by-hop options (in IPv6 main header) – Hop-by-hop options (in IPv6 extension header) – Destinations options – Routing (with segment left 0) – Routing (with segment left > 0) – TCP, UDP, or ICMP – Authentication – Any other next header field in main or extension headers 	<ul style="list-style-type: none"> – Not applicable – Not applicable – Not applicable – Not applicable – Not applicable – Not applicable – Not applicable – Not applicable – Not applicable 	<ul style="list-style-type: none"> – Yes – No – Yes – No – No – No – Yes – No – No
IPv4 packet has TCP header with Options fields	Yes	Yes
IPv4 Tunnels: <ul style="list-style-type: none"> – IPv4 packet in an IPv4 tunnel – IPv6 packet in an IPv4 tunnel 	<ul style="list-style-type: none"> – Yes (IPv4 tunnel header) – Yes (IPv4 tunnel header) 	<ul style="list-style-type: none"> – No – No
IPv6 Tunnels: <ul style="list-style-type: none"> – IPv4 packet in an IPv6 tunnel – IPv6 packet in an IPv6 tunnel 	<ul style="list-style-type: none"> – Not applicable – Not applicable 	<ul style="list-style-type: none"> – No – No
IPv4 packet has 802.3ac tag (with C-VLAN tag or S-VLAN Tag when enabled).	Yes	Yes
IPv6 packet has 802.3ac tag (with C-VLAN tag or S-VLAN Tag when enabled).	Not applicable	Yes
IPv4 frames with security features (such as encapsulated security payload)	Yes	No
IPv6 frames with security features (such as encapsulated security payload)	Not applicable	No

Receive checksum offload engine

The Receive Checksum Offload engine is used to detect errors in IP packets by calculating the header checksum and further matching it with the received header checksum. This engine also identifies a TCP, UDP, or ICMP payload in received IP packets and calculates the checksum of such payloads appropriately.

The Receive Checksum Offload Engine (Rx COE) can be enabled by setting the IPC bit of [Operating mode configuration register \(ETH_MACCCR\)](#). When this bit is set, both IPv4 and IPv6 packet in the received Ethernet packets are detected and processed for data integrity. The MAC receiver identifies IPv4 or IPv6 packets by checking for value 0x0800 or 0x86DD, respectively, in the Type field of the received Ethernet packet. This identification is applicable to single VLAN-tagged packets. It is also applicable to double VLAN-tagged packets when the EDVLP bit of the [VLAN tag register \(ETH_MACVTR\)](#) is set.

The Rx COE calculates the IPv4 header checksums and checks that they match the received IPv4 header checksums. The result of this operation (pass or fail) is given to the RFC module for insertion into the receive status word. The IP Header Error bit is set for any mismatch between the indicated payload type (Ethernet Type field) and the IP header version, or when the received packet does not have enough bytes, as indicated by the Length field of the IPv4 header (or when fewer than 20 bytes are available in an IPv4 or IPv6 header).

Packets with TCP/IP errors (header or payload) are dropped in MTL when DIS_TCP_EF bit of the [Rx queue i operating mode register \(ETH_MTLRXQiOMR\)](#) is reset and FEP bit is set.

This engine also identifies a TCP, UDP, or ICMP payload in the received IP datagrams (IPv4 or IPv6) and calculates the checksum of such payloads properly, as defined in the TCP, UDP, or ICMP specifications. This engine includes the TCP, UDP, or ICMPv6 pseudo-header bytes for checksum calculation and checks whether the received checksum field matches the calculated value. The result of this operation is given as a Payload Checksum Error bit in the receive status word. This status bit is also set if the length of the TCP, UDP, or ICMP payload does not match the expected payload length given in the IP header.

[Table 516: Receive checksum offload engine functions for different packet types](#) describes the functions supported by the Rx COE based on the packet type. When the payload of an IP packet is not processed (indicated as "No" in the table), the information (whether the checksum engine is bypassed or not) is given in the receive status.

Note: The MAC does not append any payload checksum bytes to the received Ethernet packets.

Table 516. Receive checksum offload engine functions for different packet types

Packet type	Hardware IP header checksum checking	Hardware TCP/UDP/ICMP checksum checking
Non-IPv4 or IPv6	No	No
IPv4 packet is greater than 1,522 bytes (2,000 bytes when IEEE 802.3ad support for 2K packets is enabled in the MAC)	Yes	Yes
IPv6 packet is greater than 1,522 bytes (2,000 bytes when IEEE 802.3ad Support for 2K packets is enabled in the MAC)	Not applicable	Yes
IPv4 with TCP, UDP, or ICMP	Yes	Yes
IPv4 header's protocol field contains a protocol other than TCP, UDP, or ICMP	Yes	No
IPv4 packet has IP options (IP header is longer than 20 bytes)	Yes	Yes
Packet is an IPv4 fragment	Yes	No
IPv6 packet with the following next header fields in main or extension headers: – Hop-by-hop options (in IPv6 main header) – Hop-by-hop options (in IPv6 extension header) – Destinations options – Routing (with segment left 0) – Routing (with segment left > 0) – TCP, UDP, or ICMP – Any other next header field in main or extension headers	– Not applicable – Not applicable – Not applicable – Not applicable – Not applicable – Not applicable – Not applicable	– Yes – No – Yes – Yes – No – Yes – No
IPv4 packet has TCP header with Options fields	Yes	Yes
IPv4 Tunnels: – IPv4 packet in an IPv4 tunnel – IPv6 packet in an IPv4 tunnel	– Yes (IPv4 tunnel header) – Yes (IPv4 tunnel header)	– No – No
IPv6 Tunnels: – IPv4 packet in an IPv6 tunnel – IPv6 packet in an IPv6 tunnel	– Not applicable – Not applicable	– No – No
IPv4 packet has 802.3ac tag (with C-VLAN Tag or S-VLAN Tag when enabled).	Yes	Yes
IPv6 packet has 802.3ac tag (with C-VLAN Tag or S-VLAN Tag when enabled).	Not applicable	Yes
IPv4 frames with security features (such as encapsulated security payload)	Yes	No
IPv6 frames with security features (such as encapsulated security payload)	Not applicable	No

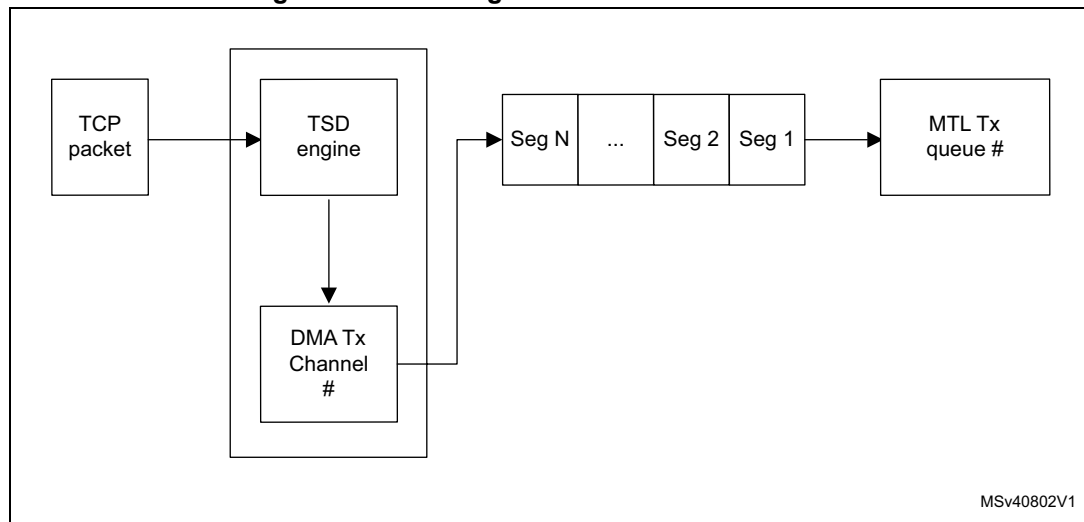

64.5.6 TCP segmentation offload

The MAC supports the TCP segmentation offload (TSO) feature in which the DMA splits a large TCP packet into multiple small packets and passes these packets to the MTL as shown in [Figure 790](#).

This feature is enabled by programming the TSE bit of corresponding ETH_DMACiCR register (see [Channel *i* transmit control register \(ETH_DMACiTXCR\)](#)). It is only supported when the MAC operates in Full-duplex mode.

For detailed programming steps, refer to [Section 64.9.15: Programming guidelines for TSO](#).

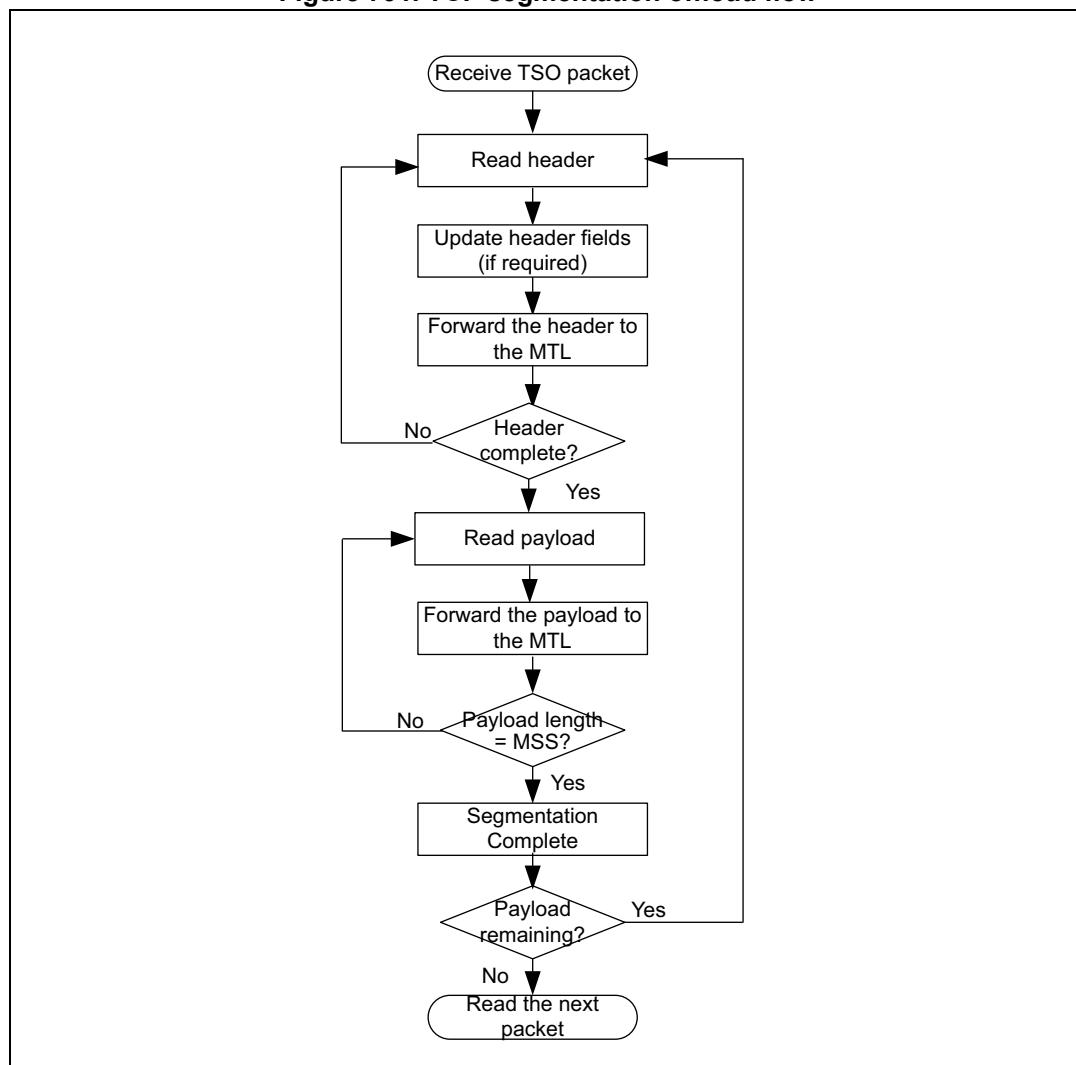

Figure 790. TCP segmentation offload overview

DMA operation with TSO feature

Figure 791 shows the TSO flow.

Figure 791. TCP segmentation offload flow

For the TSO feature, the Tx DMA operation is as follows:

1. The application sets up the Transmit descriptor (TDES0-TDES3) and sets the Own bit (TDES3[31]) after setting up the corresponding data buffer(s) with Ethernet packet data.
2. The application increases the offset value of the Descriptor tail pointer of the DMA Tx channel.
3. While in the Run state, the DMA fetches the next available descriptor and performs one of the following actions:
 - If the descriptor is a context descriptor and the context is not between the first and last descriptors of a packet, the DMA stores the context values.

- If the descriptor is a context descriptor and the context is between the first and last descriptors of a packet, the DMA closes the context descriptor indicating a Context Descriptor Error (TDES3[23]) and fetches the next descriptor.
 - If the descriptor is a normal descriptor, the DMA checks the TSE bit. If the TSE bit is not set, the DMA continues with the default mode of operation or OSF operation (if enabled).
4. The DMA calculates the number of segments from the TCP payload length (TDES3[17:0]) and the MSS value.
 5. The DMA goes through channel arbitration to fetch the data buffers. The DMA fetches the header and payload separately.
 6. For the first segment, the DMA fetches the header from the system memory and stores it in the TSO memory (if present and when the length of header is not greater than the TSO memory size). If the current segmented packet is not the first segment, it fetches again the header buffer in system memory, as done for the first segment. In such cases, the DMA does not close the first descriptor containing the header buffer until the header for last segment is fetched.
 7. The required fields in the header bytes are modified/updated as per the segmentation requirements and written into the corresponding MTL Tx queue.
 8. The DMA then takes the payload buffer pointer, fetches the MSS number of payload bytes from the system memory, and directly pushes it into the MTL Tx queue. If the buffer(s) in the descriptor do(es) not have enough data for the MSS payload (except for the last segment), the DMA closes this descriptor.
 9. The DMA jumps to Step 3 and repeats the process until the last segment is written into the Tx queue.
 10. The DMA closes the last descriptor and the first descriptor (containing the header buffer when it is not stored in TSO memory), and then moves on to the next packet transfer.

The DMA repeats all these steps if more descriptors are available. When no more descriptor are available, the DMA enters the suspend state.

Note: The TSO engine determines whether to perform TSO or USO operation based on the THL field (TCP Header Length) in TDES3 of first Normal Tx descriptor for the packet. The value of 2 indicates USO and any value greater than or equal to 5 indicates TSO.

TCP/IP header fields

While segmenting a TCP packet, the DMA automatically updates the TCP/IP header fields. [Table 517](#) describes how the TCP and IP headers are updated.

Table 517. TSO: TCP and IP header fields

Packet sequence	TCP header	IP header
First packet	<ol style="list-style-type: none"> 1. The sequence number is not updated. The value provided in the header is used. 2. If set, the FIN and PSH flags are cleared. 3. The TCP checksum is calculated again. 	IPv4 Header – Total Length = MSS + TCP Header Length + IP Header Length – Identification field is not modified. It is sent as per the header provided by the software. – IPv4 Header Checksum is recalculated. IPv6 Header – Payload Length = MSS + TCP Header Length + IP Extension Header Length
Subsequent packets	<ol style="list-style-type: none"> 1. The sequence number is updated. The MSS value is added to the sequence number value of previous segment. 2. If set, the FIN and PSH flags are cleared. 3. The TCP checksum is calculated again. 	IPv4 Header – Total Length = MSS + TCP Header Length + IP Header Length – Identification field = Previous Identification Field + 1 – IPv4 Header Checksum is recalculated IPv6 Header – Payload Length = MSS + TCP Header Length + IP Extension Header Length
Last packet	<ol style="list-style-type: none"> 1. The sequence number is updated. The MSS value is added to the sequence number value of previous segment. 2. If FIN and PSH flags were set in original header, these flags are set. 3. The TCP checksum is calculated again. 	IPv4 Header – Total Length = Remaining Payload + TCP Header Length + IP Header Length – Identification Field = Previous Identification Field + 1 – IPv4 header Checksum is recalculated IPv6 Header – Payload Length = Remaining Payload Length + TCP Header Length + IP Extension Header Length

Header and payload fields of segmented packets

After segmentation, the split packets use the same header as the parent TCP packet for header fields other than the ones described in [Table 517: TSO: TCP and IP header fields](#). [Figure 792: Header and payload fields of segmented packets](#) shows how same header is used for the header fields of segmented packets.

The application must create the header in Buffer 1 of the first descriptor of the packet to be segmented and provide the header length in TDES2 of the first descriptor (FD = 1). When the FD bit is set, the DMA reads the header from the header buffer to which the TDES0 is pointing. Buffer 2 of the first descriptor can be used for payload and TDES0 and TDES1 of subsequent descriptors. For subsequent descriptors (FD = 0), the address to which the TDES0 and TDES1 are pointing is treated as payload buffer address of the same packet.

Figure 792. Header and payload fields of segmented packets

Context descriptor sequence

The context descriptor can provide the maximum segment size (MSS) value for segmentation. The application must provide the context descriptor before the normal descriptor to be used for the corresponding TCP packet. If the application needs to provide a new MSS, it must create the context descriptor in the descriptor list before the first normal descriptor of the packet to be segmented with the new MSS value. The MSS value in the context descriptor is valid only if the TCMSSV bit of TDES3 in context descriptor is set and the OSTC bit is reset (refer to [Section 64.10.3: Transmit descriptor](#)).

When the application provides a context descriptor with a valid MSS value, the DMA internally stores the MSS value and uses this value for all subsequent packets for which the TSO is enabled through the TSE bit of TDES3 normal descriptor.

If the application places a context descriptor in the middle of a packet (between the first and last descriptors of a packet), the DMA does the following:

1. The DMA ignores the context and closes the descriptor.
2. The DMA indicates the error in descriptor status.
3. The DMA generates an interrupt if the CDEE bit is set in the Interrupt enable register corresponding to a DMA channel (see [Channel i interrupt enable register \(ETH_DMACiIER\)](#)).

The application can read the interrupt status through CDE bit of Status register corresponding to a DMA channel (see [Channel i status register \(ETH_DMACiSR\)](#)).

Building the Descriptor and the packet for the TSO feature

To enable segmentation for a packet, the application must set the TSE bit of TDES3 of first normal descriptor (see [Section 64.10.3: Transmit descriptor](#)). If the TSE bit is set in TDES3 for a non TCP/IP packet, the DMA behavior is unpredictable.

The application must program the length of the TCP packet payload in TDES3[17:0] and the TCP header in TDES3[22:19]. The maximum length of TCP packet payload that can be segmented is 256 Kbytes.

Note: The TDES3[22:19] bitfield is used as slot number in case of AV configurations. If both TSO and AV are enabled for the same DMA Tx channel (TSE bit is set in [Channel i transmit control register \(ETH_DMACiTXCR\)](#)), then do not enable slot checking for that DMA Tx channel (do not set ESC bit in [Channel i slot function control status register \(ETH_DMACiSFCSR\)](#)).

The header of the packet including Ethernet header, L3 header and L4 header should be provided in Buffer1 of the first normal descriptor of the TSO packet. Only buffer 1 of the first normal descriptor of a packet enabled for TSO is taken as the buffer containing the header.

The TCP payload can begin from buffer 2 of the first normal descriptor and continue to buffer1 and buffer 2 of second normal descriptor and subsequent descriptors.

The TCP payload may span across multiple buffers and multiple descriptors. The size of buffers containing the TCP payload should add up to be equal to the TCP payload length provided in TDES3[17:0] of the first normal descriptor.

The MAC always calculates and appends CRC and inserts Padding (if required) for all packets segmented by the DMA. If the TSE bit of TDES3 is enabled, the CRC PAD Control (CPC) field of TDES3 is reserved. To determine the size of a TCP packet after segmentation, the DMA uses the Maximum Segment Size (MSS) provided by the application through context descriptor. The DMA segments only those packets which have payload size greater than MSS. The application must provide the MSS by either programming the MSS value in ETH_DMACiCR (see [Channel i control register \(ETH_DMACiCR\)](#)) or by providing a context descriptor. The DMA uses the last programmed value of MSS or the last MSS value provided through context (whichever is provided later).

The header length plus the MSS size (which is equal to the size of each TCP segment) should not exceed 16383 bytes otherwise the MAC transmitter truncates the packet after 16383 bytes causing a CRC error.

The header length plus MSS size plus programmed PBL value in ETH_DMACiTXCR register (see [Channel i transmit control register \(ETH_DMACiTXCR\)](#)) should be lesser than the Tx queue size programmed in TQS field of ETH_MTLTXQiOMR register (see [Tx queue i](#)

operating mode Register (ETH_MTLTXQiOMR)). A MSS plus header equal to half the programmed Tx queue size is recommended.

The DMA also supports segmentation of VLAN-tagged TCP/IP frames. If the TCP packet has a VLAN tag, then the same tag is used for all the segments irrespective of the VLAN tag type provided (C-VLAN or S-VLAN). The VLAN tag insert/replace control bits are used for all segments.

If the Double VLAN feature is selected, then the DMA passes both tags for all segments irrespective of the VLAN tag types provided (C-VLAN or S-VLAN). The VLAN tag Insert/Replace control bits for both tags is applicable to all segments. If the Double VLAN feature is not selected, then the application must not set the TSE bit in TDES3 for a TCP/IP packet with two tags. The DMA behavior in this scenario is unpredictable.

If the TSE bit is set in TDES3 for the packet and TCP header length provided is less than 5 (meaning this is an invalid TCP header because it is less than 20 bytes), the DMA does not perform segmentation, instead it transmits the entire packet as a single packet. In this scenario, the CRC pad control bits are forced by DMA to 00 (MAC does CRC and padding) and checksum insertion control bits are forced to 11 (hardware does the checksum calculation for both header and payload).

64.5.7 IPv4 ARP offload

The MAC supports the Address Recognition Protocol (ARP) Offload for IPv4 packets. This feature allows to process the IPv4 ARP request packet in the receive path and to generate the corresponding ARP response packet in the transmit path.

The MAC generates the ARP reply packets for appropriate ARP request packets. ARP packets for IPv4 are L2 layer packets with Length/Type of 0x0806.

The ARP offloading sequence is as follows:

1. The MAC receiver gets an ARP request if the request Target Protocol Address matches the IPv4 address programmed in the MAC L3 register.
2. The MAC generates an ARP reply packet.
3. The MAC copies the Sender Hardware Address field in the ARP request to the following fields:
 - DA field of the Ethernet packet header
 - Target Hardware Address field of the ARP reply packet
4. The MAC copies the Sender Protocol Address field in the ARP request to the Target Protocol Address field in the ARP reply packet.
5. The MAC places its MAC address in the following fields:
 - SA field of the Ethernet packet header
 - Sender Hardware Address field of the ARP reply packet
6. The MAC copies the Target Protocol Address field in the ARP request to the Sender Protocol Address field in the ARP reply packet.
7. The MAC sets the opcode field in ARP reply packet to 2 indicating ARP reply.
8. The MAC recalculates the CRC and performs padding for the generated ARP reply packet.
9. The MAC transmitter sends the ARP reply

The MAC processes only one ARP request at a time. It does not store the fields of multiple ARP requests. If the MAC receives an ARP request when it is already processing an earlier

ARP request, the MAC does not generate the ARP reply for new ARP request. The MAC forwards the new ARP request packet to the application with ARP Reply Not Generated status bit set (bit 34). However, in power-down mode, if the MAC receives an ARP request when it is already processing an earlier ARP request, the MAC drops the new ARP request. If the Disable CRC check (DCRCC) bit of the [Extended operating mode configuration register \(ETH_MACECR\)](#) is set, then the MAC does not check for valid CRC of a ARP request packet. It can generate an ARP response packet if the other conditions are valid. The ARP request packet must always have a valid CRC.

Note: When the received ARP request is less than the 64-byte packet length, the MAC does not send an ARP response. It is treated as a normal packet and forwarded to the application based on the MAC filter settings.

64.5.8 Loopback

The MAC supports loopback of transmitted packets to its receiver.

Guidelines for using Loopback mode

Below some guidelines for using the Loopback mode:

- Enable loopback only with the Full-duplex mode. In Half-duplex mode, the carrier sense signal or collision signal inputs get sampled which may result into issues such as packet dropping.
- If the Loopback mode is enabled without connecting a PHY chip, externally generate the Tx and Rx clocks and provide these clocks to the MAC.
- Do not loop back big packets since they may get corrupted in the loopback FIFO.

The Transmit and Receive clocks can have an asynchronous timing relationship. Therefore, an asynchronous FIFO is used to make the loopback path of the transmitted data to the Receive path. The FIFO is free-running to write on the write clock (eth_mii_tx_clk) and read on every read clock (eth_mii_rx_clk). At the start of each packet read from the FIFO, the write and read pointers are reinitialized to have an offset of two or four (in 10/100 Mbps mode). This avoids overflow or underflow during a packet transfer, and ensures that the overflow or underflow occurs only during the IPG period between the packets. The FIFO depth of five or nine is sufficient to prevent data corruption for packet sizes up to 9,022 bytes with a difference of 200 ppm between (G)MII Transmit and Receive clock frequencies.

Therefore, bigger packets should not be looped back because they may get corrupted in this loopback FIFO.

At the end of every received packet, the Receive Protocol Engine module generates received packet status and sends it to the Receive Packet Controller module. The control, missed packet, and filter fail status are added to the Receive status in the Receive Packet Controller module. The MAC does not process ARP or PMT packets that are looped back.

Enabling Loopback mode

To enable this feature, program the LM bit of the [Operating mode configuration register \(ETH_MACCCR\)](#). Loopback can be enabled for all PHY interfaces. The data is always looped back through internal asynchronous FIFO on to the internal Receive MII or GMII interface, irrespective of which PHY interface is selected.

The loopback data is also passed through the corresponding transmit PHY interface block, onto the Ethernet line.

Note: During loopback, the data/packet is reflected on `gmii_txd` signal.
Preemption is not supported in Loopback mode.

64.5.9 Flow control

The transmit flow control involves transmitting Pause packets in Full-duplex mode and backpressure in Half-duplex mode to control the flow of packets from the remote end. This section describes the flow control for transmit and receive paths.

Flow control in Full-duplex mode

In Full-duplex mode, the MAC uses IEEE 802.3x Pause packets for flow control. [Table 518](#) describes the fields of a Pause packet.

Table 518. Pause packet fields

Field	Description
DA	Contains the special multicast address
SA	Contains the MAC address 0
Type	Contains 8808
MAC Control opcode	Contains 0001 for IEEE 802.3x Pause Control packets
PT	Contains Pause time specified in the PT field of the Tx Queue 0 flow control register (ETH_MACQ0TXFCR)

When the FCB bit is set, the MAC generates and transmits a single Pause packet. If the FCB bit is set again after the Pause packet transmission is complete, the MAC sends another Pause packet irrespective of whether the pause time is complete or not. To extend the pause or terminate the pause prior to the time specified in the previously-transmitted Pause packet, the application should program the Pause Time register with appropriate value and then again set the FCB bit.

Flow control in Half-duplex mode

In Half-duplex mode, the MAC uses the deferral mechanism for the flow control (backpressure). When the application requests to stop receiving packets, the MAC sends a JAM pattern of 32 bytes when it senses a packet reception, provided the transmit flow control is enabled. This results in a collision and the remote station backs off. If the application requests a packet to be transmitted, it is scheduled and transmitted even when the backpressure is activated. If the backpressure is kept activated for a long time (and more than 16 consecutive collision events occur), the remote stations abort the transmission because of excessive collisions.

[Table 519](#) describes the flow control in the Tx path for Queue 0 based on the setting of the following bits:

- EHFC bit of [Rx queue i operating mode register \(ETH_MTLRXQiOMR\)](#)
- TFE bit of [Tx Queue 0 flow control register \(ETH_MACQ0TXFCR\)](#)
- DM bit of [Operating mode configuration register \(ETH_MACCR\)](#)

Flow control is similar for all queues.

Table 519. Tx MAC flow control

EHFC	TFE	DM	Description
X	0	X	The MAC transmitter does not perform the flow control or backpressure operation.
0	1	0	The MAC transmitter performs backpressure when Bit 0 of <i>Tx Queue 0 flow control register (ETH_MACQ0TXFCR)</i> is set.
1	1	0	The MAC transmitter performs backpressure when Bit 0 of <i>Tx Queue 0 flow control register (ETH_MACQ0TXFCR)</i> is set. In addition, the MAC Tx performs backpressure when Rx queue level crosses the threshold set by Bits[10:8] of <i>Rx queue i operating mode register (ETH_MTLRXQiOMR)</i> .
0	1	1	The MAC transmitter sends the Pause packet when Bit 0 of <i>Tx Queue 0 flow control register (ETH_MACQ0TXFCR)</i> is set.
1	1	1	The MAC transmitter sends the Pause packet when Bit 0 of <i>Tx Queue 0 flow control register (ETH_MACQ0TXFCR)</i> is set. In addition, the MAC Tx sends a Pause packet when Rx queue level crosses the threshold set by Bits[10:8] of <i>Rx queue i operating mode register (ETH_MTLRXQiOMR)</i> .

Transmit flow control

The transmit flow control is enabled when TFE bit is set in *Tx Queue 0 flow control register (ETH_MACQ0TXFCR)*.

Flow control trigger

The application can request the MAC to send a Pause packet or initiate back-pressure by setting the FCB bit in the corresponding *Tx Queue 0 flow control register (ETH_MACQ0TXFCR)*.

The flow control is also triggered based on Rx Queue Threshold: the flow control operation of the MAC is enabled when the EHFC bit in the corresponding *Rx queue i operating mode register (ETH_MTLRXQiOMR)* is set. The flow control signal to the MAC is asserted when the fill level of the Rx queue crosses the threshold configured in RFA field of *Rx queue i operating mode register (ETH_MTLRXQiOMR)*. This flow control signal is de-asserted when the fill-level of the queue is lower than the threshold configured in the RFD field.

Note: The RFA sets the threshold at which the flow control is triggered and the MAC schedules to send a PAUSE frame to be sent by the local transmitter.

The remote transmitter can continue to send packets until it receives this PAUSE packet. As a result, the RXQ needs space to take in this data even after the flow control is triggered, in order to avoid overflow and loss of packets.

The maximum space required is calculated theoretically. It can be 2 max-sized packets + a little more assuming that the read from the Rx FIFO is not occurring during this whole time.

Theoretically, this makes RFA = 4 or more, which implies that RxQ must have a minimum size of 4 Kbytes.

Practically, the system works with RFA = 2 (full size – 2 Kbytes, with very little probability of overflow).

The RFA bitfield in *Rx queue i operating mode register (ETH_MTLRXQiOMR)* is used for activating the flow control. These bits control the threshold (fill-level of Rx queue) at which the flow control is activated.

With an RXQ size of 4 Kbytes, RFA must be set to 2 Kbytes to receive the whole packet.

Receive flow control

In the Receive path, the flow control is functional only in Full-duplex mode. If any Pause packet is received in Half-duplex mode, the packet is considered as a normal control packet.

Description of receive flow control

Table 520 describes the flow control in the Rx path based on the setting of the following bits:

- RFE bit of *Rx flow control register (ETH_MACRXFCR)*
- DM bit of *Operating mode configuration register (ETH_MACCCR)*

Table 520. Rx MAC flow control

RFE	DM	Description
0	x	The MAC receiver does not detect the received Pause packets.
1	0	The MAC receiver does not detect the received Pause packets but recognizes such packets as Control packets.
1	1	The MAC receiver detects or processes the Pause packets and responds to such packets by stopping the MAC transmitter.

The following sequence describes the Rx flow control:

1. The MAC checks the destination address (DA) of the received Pause packet for either of the following:
 - Multicast destination address: the DA matches the unique multicast address specified for the control packet (0x0180 C200 0001).
 - Unicast destination address: the DA matches the content of the MAC Address 0 registers (*MAC Address 0 high register (ETH_MACA0HR)* and *MAC Address x low register (ETH_MACAxLR)*) and the UP bit of *Rx flow control register (ETH_MACRXFCR)* is set.
If the UP bit is set, the MAC processes Pause packets with unicast destination address in addition to the unique multicast address.
2. The MAC decodes the following fields of the received packet:
 - Type field: this field is checked for 0x8808.
 - Opcode field: this field is checked for 0x0001 (Pause packet).
 - Pause time: the Pause time (for Pause packet) is captured to determine the time for which the transmitter needs to be blocked.
3. If the byte count of the status indicates 64 bytes and there is no CRC error, the MAC transmitter pauses the transmission of any data packet for the duration of the decoded Pause Time value multiplied by the slot time (64 byte times).

If subsequent Pause packets are received before the earlier Pause Time expires, the MAC updates the Pause Timer with new value.

Enabling receive flow control

Set the RFE bit in the *Rx flow control register (ETH_MACRXFCR)* to enable the Pause flow control.

64.5.10 MAC management counters

The peripheral supports storing the statistics about the received and transmitted packets in registers that are accessible through the application.

The counters in the MAC management counters (MMC) module can be viewed as an extension of the register address space of the CSR module. The MMC module maintains a set of registers for gathering statistics on the received and transmitted packets. The register set includes a control register for controlling the behavior of the registers, two 32-bit registers containing interrupts generated (receive and transmit), and two 32-bit registers containing masks for the Interrupt register (receive and transmit). These registers are accessible from the Application through the AHB slave interface in the same way the CSR registers are accessed. The organization of these registers is shown in [Section 64.11.4: Ethernet MAC and MMC registers](#).

The MMC counters are free running. There is no separate enable for the counters to start. A particular MMC counter starts counting when corresponding packet is received or transmitted.

The Receive MMC counters are updated for packets that are passed by the Address Filter (AFM) block. The statistics of packets dropped by the AFM module, are not updated unless they are runt packets of less than 6 bytes (DA bytes are not received fully). To get statistics of all packets, set bit 0 in the [Packet filtering control register \(ETH_MACPFR\)](#). The MMC module gathers statistics on encapsulated IPv4, IPv6, TCP, UDP, or ICMP payloads in received Ethernet packets.

In addition to control registers, two sets of registers are implemented:

- 6 registers used for collision, error and good packets counters:
 - Tx single collision good packets register ([Tx single collision good packets register \(ETH_TX_SINGLE_COLLISION_GOOD_PACKETS\)](#))
 - Tx multiple collision good packets register ([Tx multiple collision good packets register \(ETH_TX_MULTIPLE_COLLISION_GOOD_PACKETS\)](#))
 - Tx packet count good register ([Tx packet count good register \(ETH_TX_PACKET_COUNT_GOOD\)](#))
 - Rx CRC error packets register ([Rx CRC error packets register \(ETH_RX_CRC_ERROR_PACKETS\)](#))
 - Rx alignment error packets register ([Rx alignment error packets register \(ETH_RX_ALIGNMENT_ERROR_PACKETS\)](#))
 - Rx unicast packets good register ([Rx unicast packets good register \(ETH_RX_UNICAST_PACKETS_GOOD\)](#))
- 4 registers to record LPI mode transition:
 - Tx LPI microsecond timer register ([Tx LPI microsecond timer register \(ETH_TX_LPI_USEC_CNTR\)](#))
 - Tx LPI transition counter register ([Tx LPI transition counter register \(ETH_TX_LPI_TRAN_CNTR\)](#))
 - Rx LPI microsecond counter register ([Rx LPI microsecond counter register \(ETH_RX_LPI_USEC_CNTR\)](#))
 - Rx LPI transition counter register ([Rx LPI transition counter register \(ETH_RX_LPI_TRAN_CNTR\)](#))

Definitions

The following terminology is used in MMC register descriptions:

- Transmitted packets are considered “good” if transmitted successfully. In other words, a transmitted packet is good if the packets transmission is not aborted because of any of the following errors:
 - Jabber timeout
 - No carrier or loss of carrier
 - Late collision
 - Packet underflow
 - Excessive deferral
 - Excessive collision
- Received packets are considered “good” if none of the following errors exists:
 - CRC error
 - Runt packet (shorter than 64 bytes)
 - Alignment error (in 10/100 Mbps only)
 - Length error (non-Type packet only)
 - Out of range (non-Type packet only, longer than 1518 bytes)
 - GMII_RXER input error
- The maximum transmit frame size depends on the frame type, as follows:
 - Untagged frame maxsize = 1,518
 - VLAN frame maxsize = 1,522
 - Jumbo frame maxsize = 9,018
 - JumboVLAN frame maxsize = 9,022
- The maximum receive packet size depends on the packet type and control bits (JE, S2KP, GPSLCE and EDVLP), as shown in the [Table 521](#).

Table 521. Size of the maximum receive packet

JE	S2KP	GPSLCE	EDVLP	Untagged frame maximum size in bytes	Single VLAN frame maximum size in bytes	Double VLAN Frame maximum size in bytes
1	X	X	1	9018	9022	9026
0	1	X	X	2000	2000	2000
0	0	1	1	GPSL	GPSL+4	GPSL+8
0	0	0	1	1518	1522	1526
1	X	X	0	9018	9022	9022
0	0	1	0	GPSL	GPSL+4	GPSL+4
0	0	0	0	1518	1522	1522

64.5.11 Interrupts generated by the MAC

Interrupts can be generated from the MAC as a result of various events. These interrupt events are combined with the events in the DMA on the eth_sbd_intr_it signal. The MAC interrupts are of level type, that is, the interrupt remains asserted (high) until it is cleared by the application or software.

The *Interrupt status register (ETH_MACISR)* describes the events that can cause an interrupt from the MAC. The MAC interrupts are enabled by default. Each event can be prevented from asserting the interrupt on the eth_sbd_intr_it signals by setting the corresponding mask bits in the *Interrupt enable register (ETH_MACIER)*.

The interrupt register bits only indicate the block from which the event is reported. You must read the corresponding status registers and other registers to clear the interrupt.

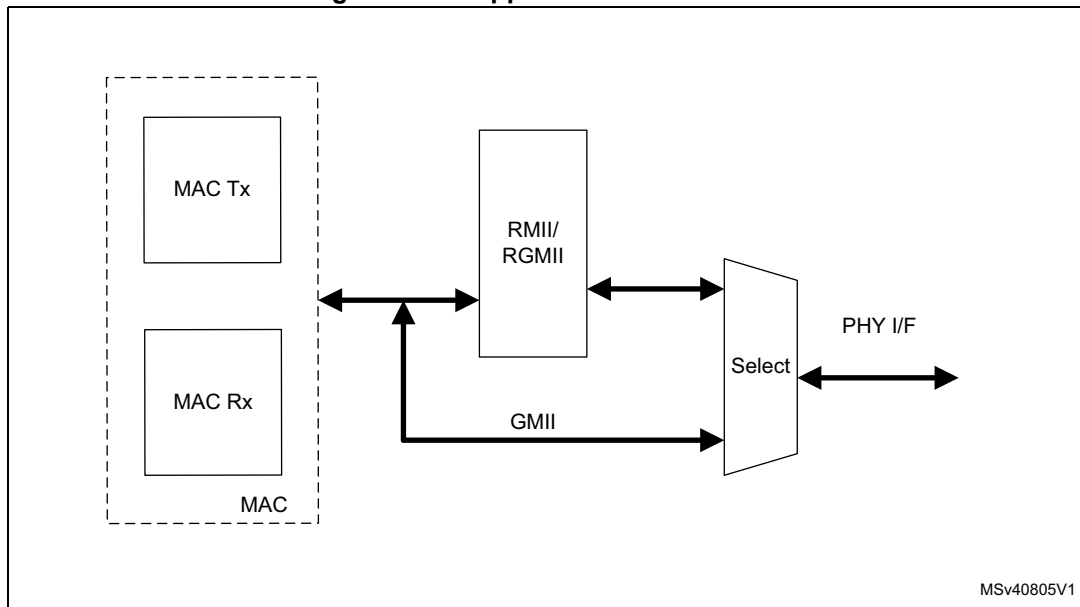

64.5.12 MAC and MMC register descriptions

Refer to [Section 64.11.4: Ethernet MAC and MMC registers](#).

64.6 Ethernet functional description: PHY interfaces

The Ethernet peripheral support several PHY interfaces. The root interface is the MII/GMII one. All other interfaces are derived from it as shown in [Figure 793](#).

Figure 793. Supported PHY interfaces

This section describes the SMA module used for PHY control and different PHY interfaces. It contains the following sections:

- [Station management agent \(SMA\)](#)
- [Media independent interface \(MII\)](#)
- [Reduced media independent interface \(RMII\)](#)
- [Reduced gigabit media independent interface \(RGMII\)](#)

64.6.1 Station management agent (SMA)

The application can access the PHY registers through the station management agent (SMA) module. The SMA includes a two-wire station management interface (MIM).

The SMA module supports accessing up to 32 PHYs. The application can address one of the 32 registers from any 32 PHYs. Only one register in one PHY can be addressed at a time. The application sends the control data to the PHY and receives status information from the PHY through the SMA module, as shown in [Figure 794](#).

Figure 794. SMA Interface block

SMA functional overview

The MAC initiates the management write or read operation with respect to the MDC clock. The MDC clock is derived from the CSR clock (eth_hclk). The maximum operating frequency of the ETH_MDC pin is 2.5 MHz, as specified in IEEE 802.3 specifications. However, a different divider can be selected if the system supports higher clock frequencies. The division factor depends on the clock range setting through CR[3:0] in the *MDIO address register (ETH_MACMDIOAR)* register. The MDC clock is selected as follows:

Table 522. MCD clock selection

Selection	eth_hclk	MDC clock
0000	60–100 MHz	CSR clock/42
0001	100–150 MHz	CSR clock/62
0010	20–35 MHz	CSR clock/16
0011	35–60 MHz	CSR clock/26
0100	150–250 MHz	CSR clock/102
0101	250–300 MHz	CSR clock/124
0110, 0111	Reserved	-

The data exchange between the MAC and the PHY is performed through a three-state buffer and brought out as ETH_MDIO line connected to the PHY.

Figure 795 shows the structure of a Clause 45 MDIO packet, while Table 523 provides a detailed description of the packet fields.

Figure 795. MDIO packet structure (Clause 45)

Table 523. MDIO Clause 45 frame structure

Field	Description
IDLE	The ETH_MDIO line is three-state; there is no clock on ETH_MDC.
PREAMBLE	32 continuous bits of value 1
START	Start of packet is 0b00
OPCODE	<ul style="list-style-type: none"> – 0b00: Address – 0b01: Write – 0b10: Read+ Address – 0b11: Read
PHY ADDR	5-bit address select for one of 32 PHYs
DEV TYPE	5-bit device type
TA	Turnaround <ul style="list-style-type: none"> – 0bZ0: Read and post-read increment address – 0b10: Write and address MDIO accesses where Z is the tri-state level
DATA	16-bit value: for an address cycle (OPCODE = 0b00), this frame contains the address of the register to be accessed on the next cycle. For the data cycle of a write frame, this field contains the data to be written to the register. For read or post-read increment address frames, this field contains the contents of the register read from the PHY. <ul style="list-style-type: none"> – In address and data write cycles, the peripheral drives the ETH_MDIO line during the transfer of these 16 bits. – In read and post-read increment address cycles, the PHY drives the ETH_MDIO line during the transfer of these 16 bits.

The frame structure for Clause 22 frames is also supported. The C45E bit in *MDIO address register (ETH_MACMDIOAR)* can be programmed to enable Clause 22 or Clause 45 mode of operation. *Figure 796* shows the structure of a Clause 22 MDIO packet, while *Table 524* provides a detailed description of the packet fields.

Figure 796. MDIO packet structure (Clause 22)

Table 524. MDIO Clause 22 frame structure

Field	Description
IDLE	The ETH_MDIO line is three-state; there is no clock on ETH_MDC.
PREAMBLE	32 continuous bits of value 1
START	Start of packet is 0b01
OPCODE	0b10 for Read and 0b01 for Write
PHY ADDR	5-bit address select for one of 32 PHYs
REG ADDR	Register address in the selected PHY
TA	Turnaround – 0bZ0: Read and post-read increment address – 0b10: Write and address MDIO accesses where Z is the tri-state level
DATA	Any 16-bit value. In a Write operation, the MAC drives ETH_MDIO. In a Read operation, the PHY drives it.

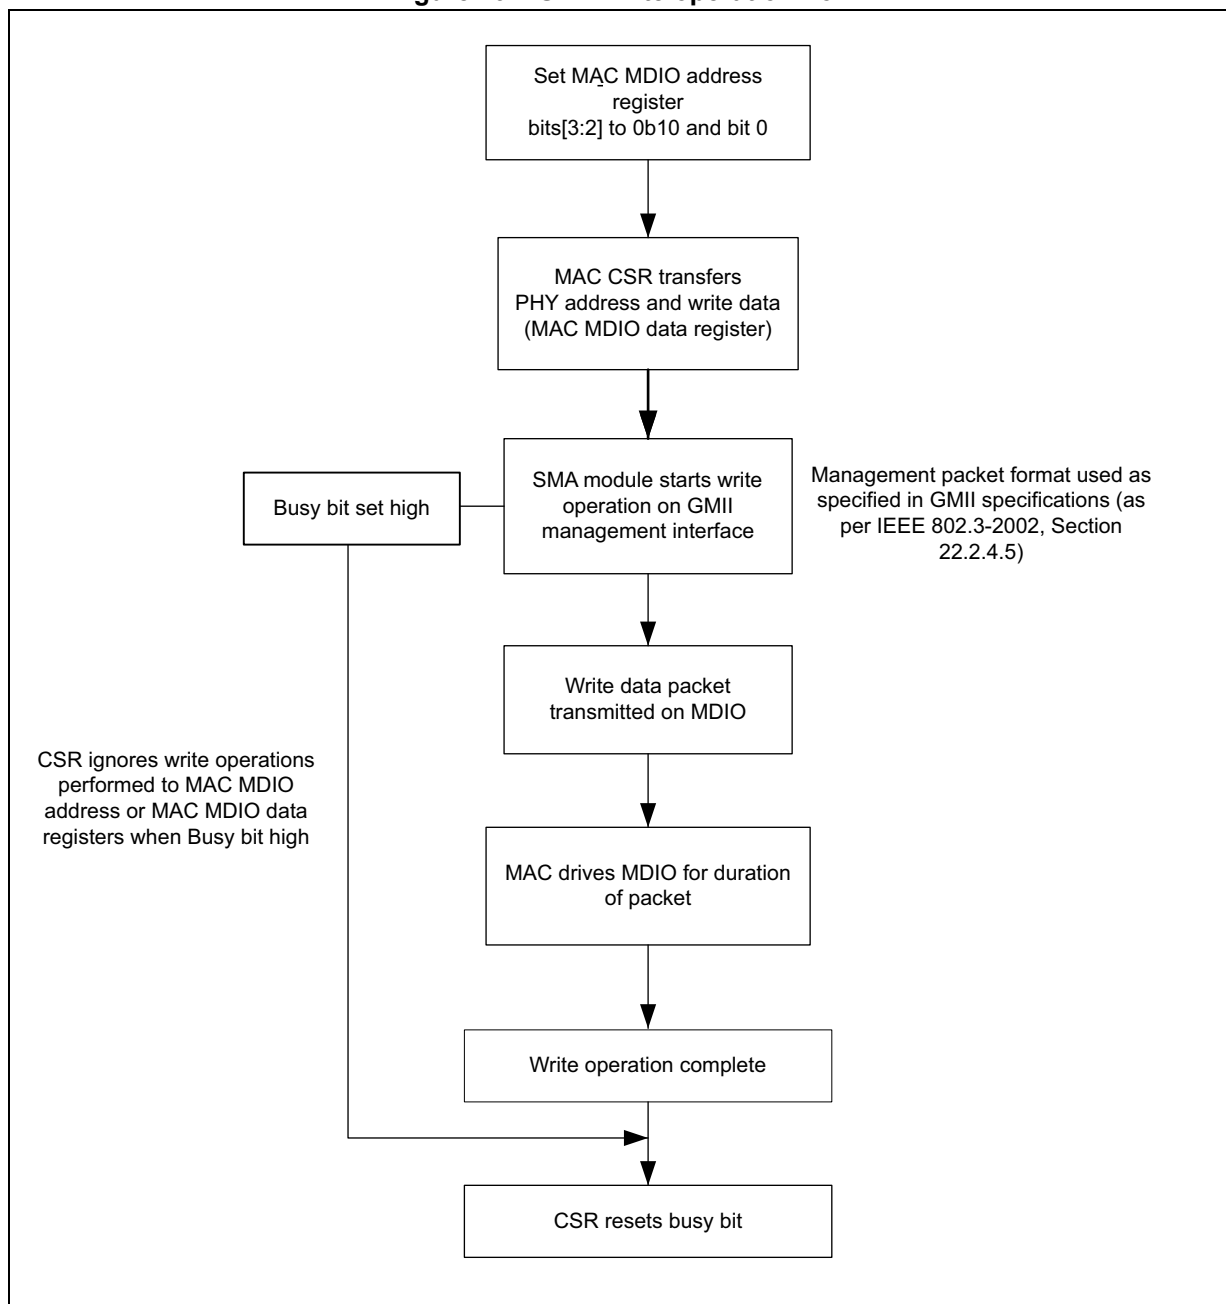

In addition to normal read and write operations, the SMA also supports post-read increment address while operating in Clause 45 mode.

GMII/MII management write operations

After the station management agent receives the PHY address and the write data from the MAC CSR module, the SMA starts a write operation to the PHY registers.

Figure 797 illustrates the flow for a write operation from the SMA module to the PHY registers.

Figure 797. SMA write operation flow

When bits[3:2] are set to 01 and bit 0 to 1 in the *MDIO address register (ETH_MACMDIOAR)*, the MAC CSR module transfers the PHY address, the register address in PHY, and the write data (*MDIO data register (ETH_MACMDIODR)*) to the SMA to initiate a Write operation into the PHY registers. At this point, the SMA module starts a Write operation on the GMII management Interface using the management packet format specified in the GMII specifications (as per IEEE 802.3-2002 specifications, Section 22.2.4.5).

When the SMA module starts a Write operation, the write data packet is transmitted on the MDIO line. The MAC drives the MDIO line for complete duration of the packet. The Busy bit is set high until the write operation is complete. The CSR ignores the Write operations per-

formed to the *MDIO address register (ETH_MACMDIOAR)* or the *MDIO data register (ETH_MACMDIODR)* during this period (the Busy bit is high). When the Write operation is complete, the SMA module indicates this to the CSR, and the CSR resets the Busy bit. The packet format for the Write operation is as follows:

Figure 798. Write data packet

IDLE	PREAMBLE	START	OPCODE	PHY ADDR	REG ADDR	TA	DATA	IDLE
Z	1111..11	01	01	AAAAA	RRRRR	10	DDD...DDD	Z

MSv40807V1

GMII/MII management read operation

When bits[3:2] are set to 11 and bit 0 to 1 in the *MDIO address register (ETH_MACMDIOAR)*, the MAC CSR module transfers the PHY address and the register address in PHY to the SMA to initiate a Read operation in the PHY registers. At this point, the SMA module starts a Read operation on the GMII/MII management interface using the management packet format specified in the GMII/MII specifications (as per IEEE 802.3-2002 specifications, *Section 22.2.4.5*).

When the SMA module starts a Read operation on the MDIO, the CSR ignores the Write operations to the *MDIO address register (ETH_MACMDIOAR)* or *MDIO data register (ETH_MACMDIODR)* register during this period (the Busy bit is high) and the transaction is completed without any error on the MCI interface. When the Read operation is complete, the SMA indicates this to the CSR. The CSR resets the Busy bit and updates the *MDIO data register (ETH_MACMDIODR)* with the data read from the PHY. The MAC drives the MDIO line for the complete duration of the frame except during the Data fields when the PHY is driving the MDIO line. For more information about the communication from the application to the PHYs, see the Reconciliation Sublayer and Media Independent Interface Specifications sections of the IEEE 802.3z, 1000BASE Ethernet.

The packet format for the Read operation is as follows:

Figure 799. Read data packet

IDLE	PREAMBLE	START	OPCODE	PHY ADDR	REG ADDR	TA	DATA	IDLE
Z	1111..11	01	10	AAAAA	RRRRR	Z0	DDD...DDD	Z

MSv40808V1

Preamble suppression

The IEEE standard specifies 32-bit preamble (all-ones) for the MDIO frames. The peripheral provides controls to support preamble suppression. It transmits MDIO frames with only 1 preamble bit. The preamble suppression can be enabled by setting the PSE bit in [MDIO address register \(ETH_MACMDIOAR\)](#).

Trailing clocks and back-to-back transactions

The peripheral drives the ETH_MDC clock for the duration of the MDIO frame. There is no clock driven during the idle period. The trailing clock feature can be used if the PHY needs the ETH_MDC clock to be active for some cycles after the MDIO frame. The NTC[2:0] bitfield in [MDIO address register \(ETH_MACMDIOAR\)](#) allows the programming of trailing clocks from 0 to 7.

The peripheral supports back-to-back transactions which allow starting the next MDIO frame even before the trailing clocks are complete for previous MDIO frame. This feature can be enabled by setting BTB bit in [MDIO address register \(ETH_MACMDIOAR\)](#) when the trailing clock feature is also enabled. When back-to-back transactions are enabled, the GMII busy bit (GB) is cleared immediately after MDIO frame completion. This allows the software to issue the next command, which is executed by the peripheral while trailing clocks are still on for the previous MDIO frame. When (GB) transactions are not enabled, the GMII busy bit is cleared after the trailing clocks are complete for the MDIO frame.

Interrupt for MDIO transaction completion

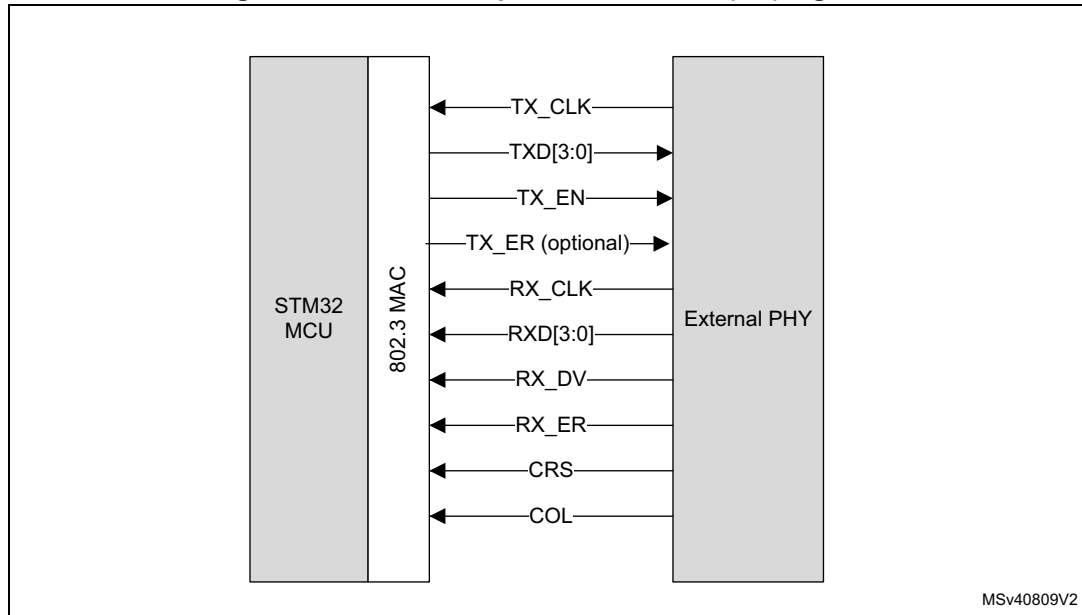

The peripheral can generate an interrupt on completion of MDIO read or write transactions. Therefore, the application need not poll the GMII busy bit of the [MDIO address register \(ETH_MACMDIOAR\)](#) to know the completion of MDIO commands.

64.6.2 Media independent interface (MII)

The media-independent interface (MII) defines the interconnection between the MAC sublayer and the PHY for data transfer at 10 Mbit/s and 100 Mbit/s.

MII signals are given in [Figure 800: Media independent interface \(MII\) signals](#).

Figure 800. Media independent interface (MII) signals

- **TX_CLK**: continuous clock that provides the timing reference for Tx data transfers. The nominal frequency is 2.5 MHz at 10 Mbit/s and 25 MHz at 100 Mbit/s.
- **TXD[3:0]**: transmit data.
TXD is a bundle of 4 data signals driven synchronously by the MAC sublayer and qualified (valid data) on the assertion of the TX_EN signal. TXD[0] is the least significant bit, TXD[3] is the most significant bit. While TX_EN is deasserted, the transmit data must have no effect upon the PHY.
- **TX_EN**: transmission enable signal indicating that the MAC is presenting nibbles on the MII for transmission. It must be asserted synchronously (TX_CLK) with the first nibble of the preamble and must remain asserted while all nibbles to be transmitted are presented to the MII.
- **TX_ER (optional)**: required only for Energy Efficient Ethernet (EEE). The transmit error is indicated by inverting the CRC. The remote station can detect the Transmit error through incorrect CRC.
- **RX_CLK**: continuous clock that provides the timing reference for Rx data transfers. The nominal frequency is 2.5 MHz at 10 Mbit/s, 25 MHz at 100 Mbit/s.
- **RXD[3:0]**: receive data
RXD is a bundle of 4 data signals driven synchronously by the PHY and qualified (valid data) on the assertion of the RX_DV signal. RXD[0] is the least significant bit, RXD[3] is

the most significant bit. While RX_EN is deasserted and RX_ER is asserted, a specific RXD[3:0] value is used to transfer specific information from the PHY.

- RX_DV: receive data valid

This signal indicates that the PHY is presenting recovered and decoded nibbles on the MII for reception. It must be asserted synchronously (RX_CLK) with the first recovered nibble of the frame and must remain asserted through the final recovered nibble. It must be deasserted prior to the first clock cycle that follows the final nibble. In order to receive the frame correctly, the RX_DV signal must encompass the frame, starting no later than the SFD field.

- RX_ER: receive error

This signal must be asserted for one or more clock periods (RX_CLK) to indicate to the MAC sublayer that an error was detected somewhere in the frame. This error condition must be qualified by RX_DV assertion.

- CRS: carrier sense.

This signal is asserted by the PHY when either the transmit or receive medium is non idle. It must be deasserted by the PHY when both transmit and receive media are idle. The PHY must ensure that the CS signal remains asserted throughout the duration of a collision condition. This signal is not required to transition synchronously with respect to the Tx and Rx clocks. In Full-duplex mode the state of this signal is don't care for the MAC sublayer.

- COL: collision detection signal

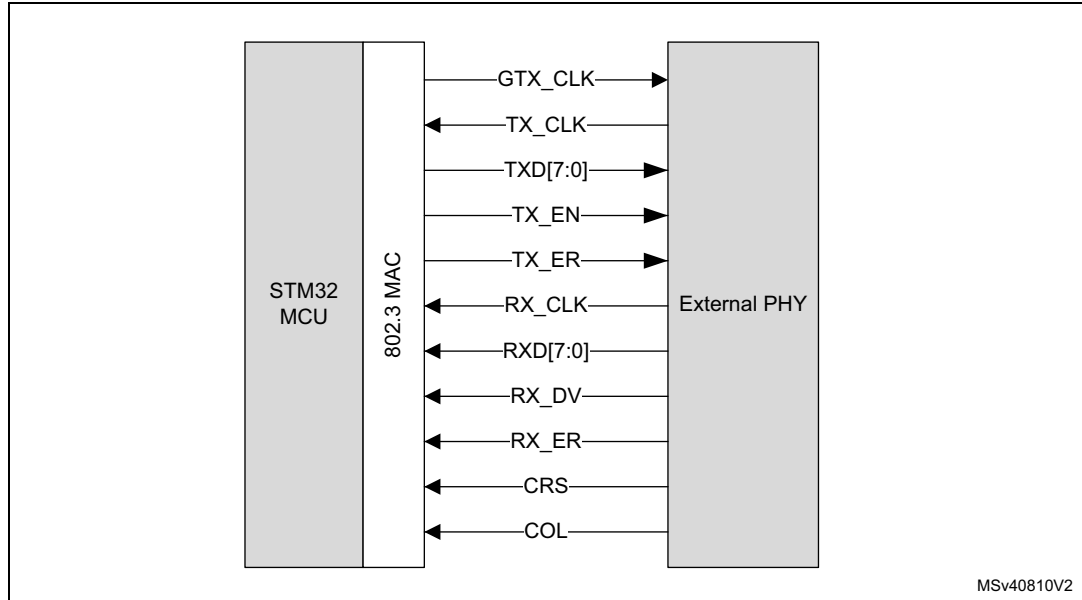

This signal must be asserted by the PHY upon detection of a collision on the medium and must remain asserted while the collision condition persists. This signal is not required to transition synchronously with respect to the Tx and Rx clocks. In Full-duplex mode, the state of this signal is don't care for the MAC sublayer.

64.6.3 Gigabit media independent interface (GMII)

The gigabit media independent interface (GMII) defines the interconnection between the MAC sublayer and the PHY for data transfer at 10 Mbit/s, 100 Mbit/s and 1000 Mbit/s.

GMII signals are given in [Figure 801](#).

Figure 801. Giga media independent interface (GMII) signals

- **GTX_CLK**: at 1000 Mbit/s, GTX_CLK is output from an STM32 internal oscillator and transmitted to the PHY interface.
- **TX_CLK**: continuous clock that provides the timing reference for Tx data transfers for 10 Mbit/s and 100 Mbit/s operation. The nominal frequency is 2.5 MHz at 10 Mbit/s and 25 MHz at 100 Mbit/s.
- **TXD[7:0]**: transmit data
TXD is a bundle of 8 data signals driven synchronously by the MAC sublayer and qualified (valid data) on the assertion of the TX_EN signal. TXD[0] is the least significant bit, TXD[7] is the most significant bit. While TX_EN is deasserted the transmit data must have no effect upon the PHY.
- **TX_EN**: transmission enable signal indicating that the MAC is presenting nibbles on the MII for transmission. It must be asserted synchronously (TX_CLK) with the first nibble of the preamble and must remain asserted while all nibbles to be transmitted are presented to the MII.
- **TX_ER**: indicates a Transmit error or carrier extension on TXD[7:0]
- **RX_CLK**: continuous clock that provides the timing reference for Rx data transfers. The nominal frequency is 2.5 MHz at 10 Mbit/s, 25 MHz at 100 Mbit/s and 125 MHz at 1000 Mbit/s.
- **RXD[7:0]**: receive data
RXD is a bundle of 8 data signals driven synchronously by the PHY and qualified (valid data) on the assertion of the RX_DV signal. RXD[0] is the least significant bit, RXD[7] is

the most significant bit. While RX_EN is deasserted and RX_ER is asserted, a specific RXD[3:0] value is used to transfer specific information from the PHY.

- RX_DV: receive data valid

This signal indicates that the PHY is presenting recovered and decoded nibbles on the MII for reception. It must be asserted synchronously (RX_CLK) with the first recovered nibble of the frame and must remain asserted through the final recovered nibble. It must be deasserted prior to the first clock cycle that follows the final nibble. In order to receive the frame correctly, the RX_DV signal must encompass the frame, starting no later than the SFD field.

- RX_ER: receive error

This signal must be asserted for one or more clock periods (RX_CLK) to indicate to the MAC sublayer that an error was detected somewhere in the frame. This error condition must be qualified by RX_DV assertion.

- CRS: carrier sense.

This signal is asserted by the PHY when either a transmit or receive medium is non idle. It shall be deasserted by the PHY when both transmit and receive media are idle. The PHY must ensure that the CS signal remains asserted throughout the duration of a collision condition. This signal is not required to transition synchronously with respect to the Tx and Rx clocks. In Full-duplex mode the state of this signal is don't care for the MAC sublayer.

- COL: collision detection signal

This signal must be asserted by the PHY upon detection of a collision on the medium and must remain asserted while the collision condition persists. This signal is not required to transition synchronously with respect to the Tx and Rx clocks. In Full-duplex mode the state of this signal is don't care for the MAC sublayer.

64.6.4 Reduced media independent interface (RMII)

The reduced media independent interface (RMII) specification reduces the pin count between Ethernet PHYs and STM32 MCU (only in 10/100 mode). According to the IEEE 802.3u, an MII contains 16 pins for data and control. RMII specification reduces the pin count to 7.

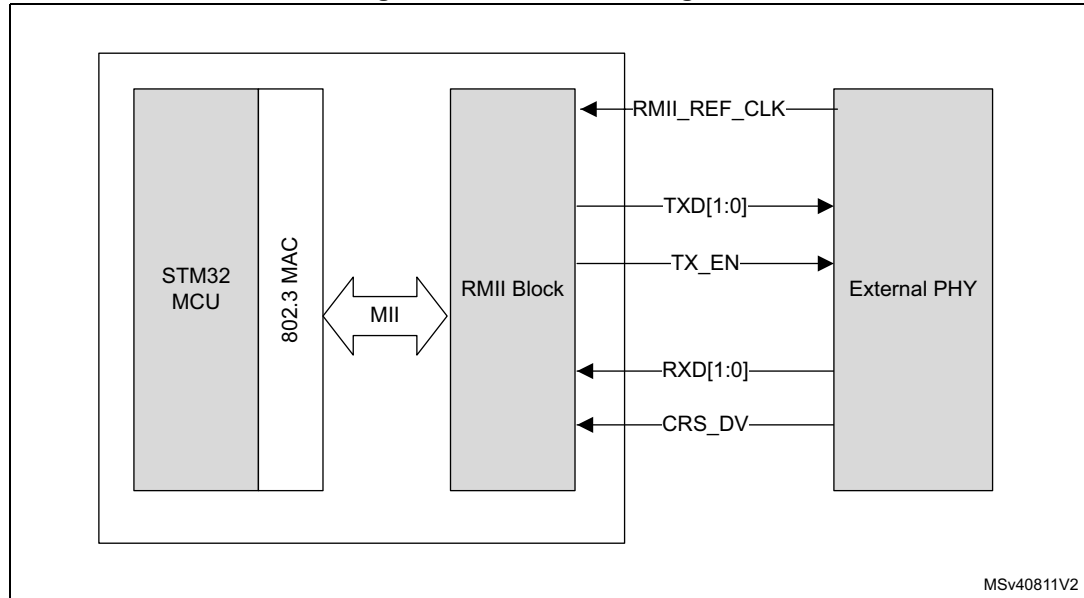

Part of the Ethernet peripheral, the RMII module is instantiated at the MAC output. This helps in translating the MII of the MAC into the RMII. The RMII block has the following characteristics:

- Supports 10 Mbps and 100 Mbps operating rates. It does not support the 1000 Mbps operation.
- Provides independent 2-bits wide Transmit and Receive paths by sourcing two clock references externally.

RMII block diagram

Figure 802: RMII block diagram shows the position of the RMII block relative to the MAC and RMII PHY. The RMII block is placed in front of the MAC to translate the MII signals to RMII signals.

Figure 802. RMII block diagram

- RMII_REF_CLK: continuous 50 MHz reference clock input
- TXD[1:0]: transmit data
- TX_EN: transmit data enable.
When high, this bit indicates that valid data are being transmitted on TXD[1:0].
- RXD[1:0]: receive data
- CRS_DV: carrier Sense (CRS) and RX_Data Valid (RX_DV) multiplexed on alternate clock cycles. In 10 Mbit/s mode, it alternates every 10 clock cycles.

Transmit bit order

Each nibble from the MII interface must be transmitted on the RMI interface di-bit at a time with the order of di-bit transmission shown in [Figure 803: Transmission bit order](#). The lower order bits (D1 and D0) are transmitted first followed by higher order bits (D2 and D3).

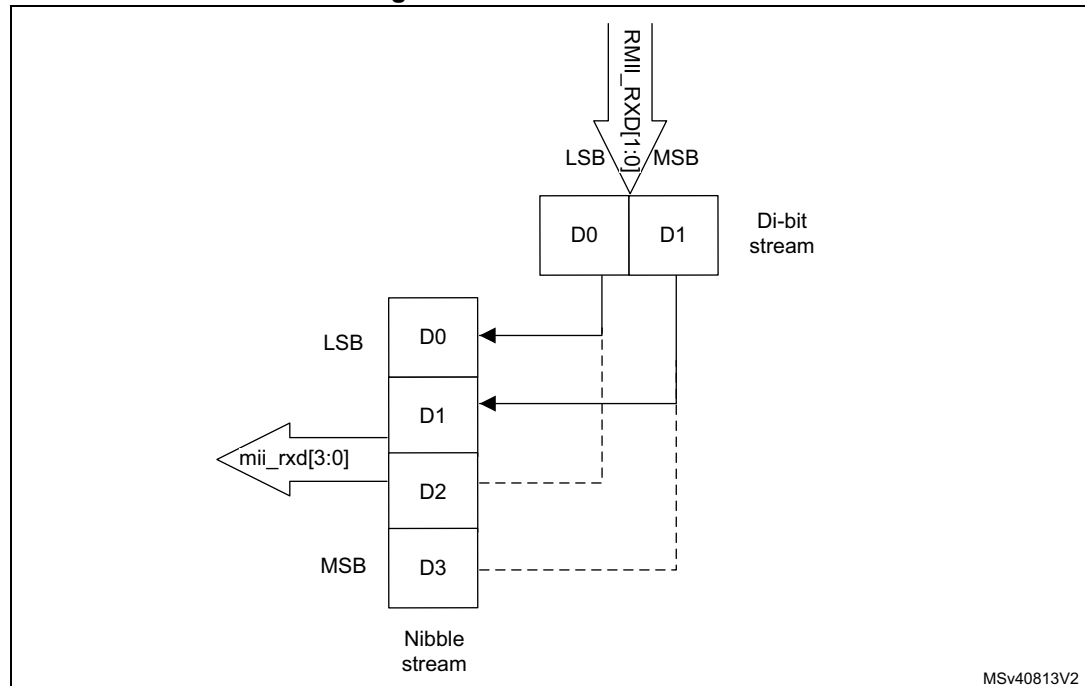

Figure 803. Transmission bit order

Receive bit order

Each nibble is transmitted to the MII interface from the di-bit received from the RMII interface in the nibble transmission order shown in [Figure 804: Receive bit order](#). The lower order bits (D0 and D1) are received first, followed by the higher order bits (D2 and D3).

Figure 804. Receive bit order

64.6.5 Reduced gigabit media independent interface (RGMII)

The reduced gigabit media independent interface (RGMII) specification reduces the pin count of the interconnection between the MAC and the PHY for GMII and MII interfaces. To achieve this, the data path and control signals are reduced and multiplexed together with both edges of the Transmit and Receive clocks. For Gigabit operation, the clocks operate at 125 MHz; for 10/100 operation, the clock rates are 2.5/25 MHz.

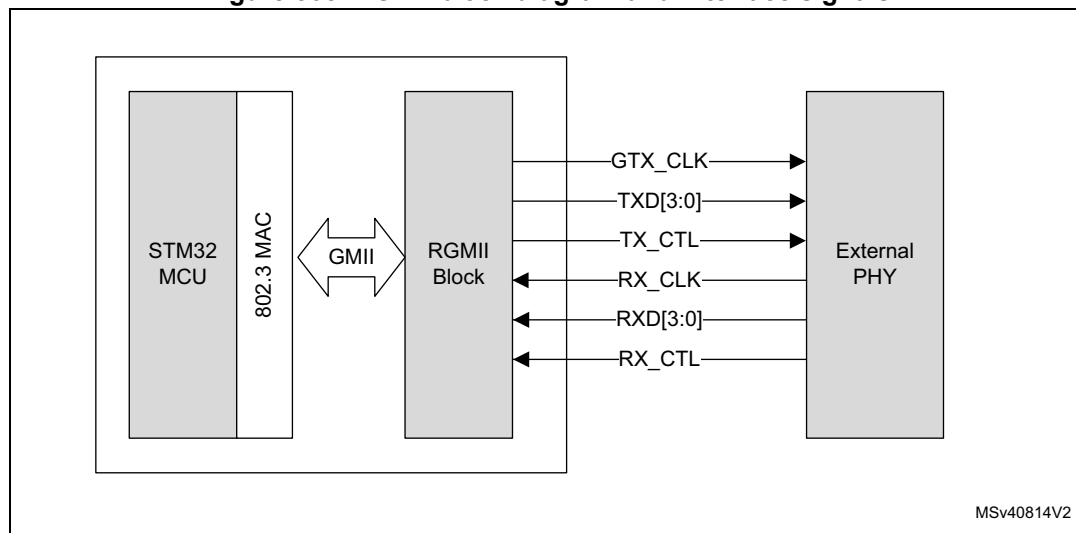

The RGMII module is instantiated between the GMII of the MAC and the PHY to translate the control and data signals between the GMII and RGMII protocols. The RGMII block has the following characteristics:

- Support of 10, 100 and 1000 Mbps operation rates.
- No extra clock required since both edges of the incoming clocks are used.
- Extraction of the in-band (link speed, link status, and duplex mode) status signals from the PHY and provides them to the MAC for link detection.

RGMII block diagram

Figure 805: RGMII block diagram and interface signals shows the position of the RGMII block relative to the MAC and RGMII PHY. The RGMII block is placed between the GMII and the PHY to translate the GMII signals to RGMII signals.

Figure 805. RGMII block diagram and interface signals

- **Transmit path:** this block translates all GMII transmit signals to RGMII signals. The block registers all GMII input signals at the rising edge of `eth_gmii_gtx_clk` and generates all RGMII transmit signals at the rising and falling edges of `eth_gmii_gtx_clk`.
- **Receive path:** this block translates all RGMII receive signals to GMII receive signals. The block registers all RGMII input signals at the rising and falling edges of `eth_gmii_rx_clk` and generates all GMII receive signals at the rising edge of `eth_gmii_rx_clk`.
- GTX_CLK: RGMII clock for Tx data transfers, 125 MHz, 25 MHz or 2.5 MHz
- TXD[3:0]: transmit data
- TX_CTL: multiplexing of TX_EN on the rising edge of GTX_CLK, and a logical XOR between TX_EN and TX_ER values on falling edge of GTX_CLK
- RX_CLK: RGMII clock for Rx data transfers
- RXD[3:0]: receive data
- RX_CTL: after demultiplexing, this pin provides ETH_RX_DV on the rising edge of ETH_RX_CLK, and ETH_RX_ER (logical XOR between ETH_RX_CTL values on rising edge and falling edge of ETH_RX_CLK).

Signal conversion

The RGMII block performs data conversions in both directions.

Transmit data conversion

As defined in the RGMII specification, multiplexing of data and control in Gigabit mode is accomplished by using both edges of the Transmit clock. The RGMII block accepts the 8-bit GMII transmit data from the MAC GMII (`gmii_txd[7:0]`) on the rising edge of `eth_gmii_gtx_clk`. For Gigabit operation, the RGMII block then converts `gmii_txd[7:0]` to two 4-bit nibbles and transmits the data on the RGMII transmit data port (`rgmii_txd_o[3:0]`) as follows:

- At the rising edge of `eth_gmii_gtx_clk`, `rgmii_txd_o[3:0]` contains `gmii_txd[3:0]`
- At the falling edge of `eth_gmii_gtx_clk`, `rgmii_txd_o[3:0]` contains `gmii_txd[7:4]`

For 10/100 mode, the Transmit data to the PHY is 4 bits. Therefore, for 10/100 mode, the RGMII block drives the `gmii_txd[3:0]` data to the PHY on `rgmii_txd_o[3:0]` at the rising edge of `eth_gmii_gtx_clk`.

Receive data conversion

In 1000-Mbps mode, the RGMII block registers the 4-bit data on the `rgmii_rxd_i[3:0]` signal at both edges of the Receive clock (`eth_gmii_rx_clk`) and transfers the resulting 8-bit data to the MAC GMII on the rising edge of `eth_gmii_rx_clk` clock, as follows:

- `gmii_rxd[3:0]` is the value received on `rgmii_rxd_i[3:0]` at the rising edge of `eth_gmii_rx_clk`
- `gmii_rxd[7:4]` is the value received on `rgmii_rxd_i[3:0]` at the falling edge of `eth_gmii_rx_clk`

In 10/100 mode, the RGMII block registers the 4-bit data on `rgmii_rxd_i[3:0]` only at the rising edge of `eth_gmii_rx_clk` and transfers the data to the MAC GMII on the rising edge of `eth_gmii_rx_clk`, as follows:

- `gmii_rxd[3:0]` is the value received on `rgmii_rxd_i[3:0]` at the rising edge of `eth_gmii_rx_clk`.
- `gmii_rxd[7:4]` is 0x0.

64.7 Ethernet low-power modes

64.7.1 Low-power management

The Ethernet peripheral supports the following techniques to save power:

- Magic packet
- Remote wakeup

The magic packet and remote wakeup techniques are used to save power in the host system when it is idle (Sleep mode) and has to be woken up only at the reception of specific packets from the Ethernet network. In Sleep mode, the power to the host logic along with the majority of the peripheral (except the MAC receiver logic), can be shut down. On receiving the specific packets from the network, the MAC provides the trigger to restore the power to the host system and come back to normal state.

The Energy Efficient Ethernet (EEE) mode is compliant with the IEEE 802.3az-2010 standard. It is primarily targeted to save power in the Ethernet port when there is no traffic on the line. In this mode, the host indicates to the far-end that it does not have any packets to transmit in the near future and puts the transmitter port (MAC controller, PCS and PHY layers) in low-power mode. Similarly, the receiver port can also be put in low-power mode when the far-end host indicates that it does not have any traffic to transfer. This allows significant saving of power in the Ethernet port (mainly in the PHY) with intermittent and bursty traffic profile. The triggering of entry and exit out of the EEE mode is controlled by the MAC and is supported within the peripheral.

Simultaneous operation of the EEE mode along with any or both the other power saving modes is also supported.

Description of magic packet mode

This section describes how to save power through magic packet detection.

Note: The magic packet feature is based on the magic packet technology white paper from Advanced Micro Device (AMD).

The watchdog timeout limit for a magic packet is 2,048 bytes irrespective of the value programmed in WD bit in [Operating mode configuration register \(ETH_MACCCR\)](#) and PWE bit in [Watchdog timeout register \(ETH_MACWTR\)](#).

In the magic-packet-based power saving mode, the reception of a valid magic packet by the MAC receiver triggers an exit from low-power mode. The MAC enters power saving mode when PWRDWN bit of [PMT control status register \(ETH_MACPCSR\)](#) is programmed to 1. Exit from the magic-packet-based power saving mode is enabled by setting the MGKPKTEN bit of [PMT control status register \(ETH_MACPCSR\)](#) to 1.

The magic packet contains a unique pattern at any offset after the Destination address, Source address, and Length/Type fields. In addition to the unique pattern matching, the MAC receiver also checks for the following, to detect the received packet as a valid magic packet:

- The packet must be addressed to it (Destination Address of the received packet should perfectly match the [MAC Address 0 high register \(ETH_MACA0HR\)](#) and [MAC Address 0 low register \(ETH_MACA0LR\)](#)) or with multicast/broadcast address.
- The packet must not have any length error, FCS error, dribble bit error, GMII error, and collision.

- The packet must not be runt (length including Ethernet header and FCS is at least 64 bytes).

Magic packet data format

The content of the unique pattern in magic packets is described as follows:

- Six bytes of all-ones (0xFF FF FF FF FF FF) called synchronization stream. There can be more than six bytes of 0xFF, but only the last six are considered.
- The synchronization stream is immediately followed by 16 repetitions of the Destination address field of the packet (*MAC Address 0 high register (ETH_MACA0HR)* and the *MAC Address 0 low register (ETH_MACA0LR)*) or multicast/broadcast address.
- No break or interruption between synchronization stream and first repetition of Destination address field or within its 16 repetitions.

If the MAC address of a node is 0x00 11 22 33 44 55, the MAC scans for the following data sequence:

```

Destination Address Source Address Length/Type..... FF FF FF FF FF FF
00 11 22 33 44 55 00 11 22 33 44 55 00 11 22 33 44 55 00 11 22 33 44 55
00 11 22 33 44 55 00 11 22 33 44 55 00 11 22 33 44 55 00 11 22 33 44 55
00 11 22 33 44 55 00 11 22 33 44 55 00 11 22 33 44 55 00 11 22 33 44 55
00 11 22 33 44 55 00 11 22 33 44 55 00 11 22 33 44 55 00 11 22 33 44 55
...CRC
    
```

Description of remote wakeup packet mode

This section describes the power saving mode based on remote wakeup packet.

Note: The remote wakeup packet feature implementation is based on the Device Class Power Management Reference Specification and various implementation-specific white papers. The watchdog timeout limit for a magic packet is 2,048 bytes irrespective of the value programmed in WD bit in Operating mode configuration register (ETH_MACCCR) and PWE bit in Watchdog timeout register (ETH_MACWTR).

In the remote-wakeup-magic-packet-based power saving mode, the reception of expected remote wakeup packet by the MAC receiver triggers the exit from low-power mode. The MAC enters power saving mode when PWRDWN bit in *PMT control status register (ETH_MACPCSR)* is programmed to 1. Exit from the remote-wakeup-magic-packet-based power saving mode is enabled by programming RWKPKTEN bit of *PMT control status register (ETH_MACPCSR)* to 1.

The MAC implements a filter lookup table (programmed through *Remote wakeup packet filter register (ETH_MACRWKPFRR)* in which CRC, offset, and byte mask of the pattern embedded in remote wakeup packet and the filter operation commands are programmed.

The pattern embedded in the remote wakeup packet is located at any offset after the Destination address and Source address fields. In addition to the CRC match for the pattern, the MAC receiver also checks the following, to detect the received packet as a valid remote wakeup packet:

- The packet must be addressed to it (Destination Address of the received packet should perfect match the *MAC Address 0 high register (ETH_MACA0HR)* and *MAC Address 0 low register (ETH_MACA0LR)*) or with multicast/broadcast address.
- The packet must not have any length error, FCS error, dribble bit error, GMII error, and collision.

- The packet must not be runt (length including Ethernet header and FCS is at least 64 bytes).

When a valid remote wakeup packet is received, the MAC receiver sets the RWKPRCVD bit in *PMT control status register (ETH_MACPCSR)* and triggers the interrupt on pmt_intr_o output port. The PMTIS bit in *Interrupt status register (ETH_MACISR)* is set when power-gating is not enabled in low-power mode. An interrupt is triggered to the application on the sbd_intr_o output port when interrupt is enabled (PMTIE bit in *Interrupt enable register (ETH_MACIER)* is set) and CSR clock is not gated off in low-power mode.

Remote wakeup packet filters

When the remote-wakeup-based power saving mode is enabled, four remote wakeup filters can be selected. The structure of the remote wakeup filters is shown in *Table 525: Remote wakeup packet filter register*.

Table 525. Remote wakeup packet filter register

ETH_MACRWKPFPR value	Field							
0	Filter 0 byte mask							
1	Filter 1 byte mask							
2	Filter 2 byte mask							
3	Filter 3 byte mask							
4	Reserved	Filter 3 command	Reserved	Filter 2 command	Reserved	Filter 1 command	Reserved	Filter 0 command
5	Filter 3 offset		Filter 2 offset		Filter 1 offset		Filter 0 offset	
6	Filter 1 CRC - 16				Filter 0 CRC - 16			
7	Filter 3 CRC - 16				Filter 2 CRC - 16			

The remote wakeup filter fields are described in *Table 526: Description of the remote wakeup filter fields*.

Table 526. Description of the remote wakeup filter fields

Register	Description
Filter <i>i</i> Byte mask	<p>The filter <i>i</i> byte mask register defines the bytes of the packet that are examined by filter <i>i</i> (0, 1, 2 or 3) to determine whether or not a packet is a wakeup packet.</p> <ul style="list-style-type: none"> – The MSB (31st bit) must be zero. – Bit j[30:0] is the byte mask. – If Bit j (byte number) of the byte mask is set, the CRC block processes the Filter <i>i</i> Offset + j of the incoming packet; otherwise Filter <i>i</i> Offset + j is ignored.
Filter <i>i</i> Command	<p>The 4-bit filter <i>i</i> command controls the filter <i>i</i> operation.</p> <ul style="list-style-type: none"> – Bit 3 specifies the address type, defining the destination address type of the pattern. When the bit is set, the pattern applies to only multicast packets; when the bit is reset, the pattern applies only to unicast packet. – Bit 2 (Inverse mode), when set, reverses the logic of the CRC16 Hash function signal, to reject a packet with matching CRC_16 value. Bit 2, along with Bit 1, allows a MAC to reject a subset of remote wakeup packets by creating filter logic such as "Pattern 1 AND NOT Pattern 2". – Bit 1 (And_Previous) implements the Boolean logic⁽¹⁾. When set, the result of the current entry is logically ANDed with the result of the previous filter. This AND logic allows a filter pattern longer than 32 bytes by splitting the mask among two, three, or four filters. This depends on the number of filters that have the And_Previous bit set. – Bit 0 is the enable for filter <i>i</i>. If Bit 0 is not set, filter <i>i</i> is disabled.
Filter <i>i</i> Offset	<p>This filter <i>i</i> offset register defines the offset (within the packet) from which the filter <i>i</i> examines the packets.</p> <ul style="list-style-type: none"> – This 8-bit pattern-offset is the offset for the filter <i>i</i> first byte to be examined. – The minimum allowed offset is 12, which refers to the 13th byte of the packet. – The offset value 0 refers to the first byte of the packet.
Filter <i>i</i> CRC-16	<p>This filter <i>i</i> CRC-16 register contains the CRC_16 value calculated from the pattern and also the byte mask programmed to the wakeup filter register block.</p> <ul style="list-style-type: none"> – The 16-bit CRC calculation uses the following polynomial: $G(x) = x^{16} + x^{15} + x^2 + 1$ Each mask, used in the Hash function calculation, is compared with a 16-bit value associated with that mask. Each filter has the following: – 32-bit Mask: Each bit in this mask corresponds to one byte in the detected packet. If the bit is '1', the corresponding byte is taken into the CRC16 calculation. – 8-bit Offset Pointer: Specifies the byte to start the CRC16 computation. <p>The pointer and the mask are used together to locate the bytes to be used in the CRC16 calculations.</p>

1. The And_Previous bit setting is applicable within a set of four filters. Setting And_Previous bit of a filter that is not enabled has no effect, that is setting And_Previous bit of lowest number filter in the set of four filters has no effect. For example, setting And_Previous bit of Filter 0 has no effect. If And_Previous bit is set for a given filter to form an AND chained filter, the AND chain breaks when it finds a disabled filter. For example: If Filter 2 And_Previous bit is set (bit 1 in Filter 2 command is set) but Filter 1 is not enabled (bit 0 in Filter 1 command is reset), then only Filter 2 result is considered. If Filter 2 And_Previous bit is set (bit 1 in Filter 2 command is set), Filter 3 And_Previous bit is set (bit 1 in Filter 3 command is set), but Filter 1 is not enabled (bit 0 in Filter 1 command is reset), then only Filter 2 result ANDed with Filter 3 result is considered. If Filter 2 And_Previous bit is set (bit 1 in Filter 2 command is set), Filter 3 And_Previous bit is set (bit 1 in Filter 3 command is set), but Filter 2 is not enabled (bit 0 in Filter 2 command is reset), then since setting Filter 2 And_Previous bit has no effect, only Filter 1 result ORed with Filter 3 result is considered. If filters chained by And_Previous bit setting have complementary programming, then a frame may never pass the AND chained filter. For example, if Filter 2 And_Previous bit is set (bit 1 in Filter 2 command is set), Filter 1 Address_Type bit is set (bit 3 in Filter 1 command is set) indicating multicast detection and Filter 2 Address_Type bit is reset (bit 3 in Filter 2 command is reset) indicating unicast detection or vice versa, then a remote wakeup frame does not pass the AND chained filter as a remote wakeup frame cannot be of both unicast and multicast address types.

The remote wakeup filter registers are implemented as eight indirect access registers (wkuppkfilter_reg#i) for four remote wakeup filters, and accessed by the application through *Remote wakeup packet filter register (ETH_MACRWKPFRR)*. The entire set of wkuppkfilter_reg registers must be written to program the remote wakeup filters. The wkuppkfilter_reg register is programmed by sequentially writing the eight register values in *Remote wakeup packet filter register (ETH_MACRWKPFRR)* for wkuppkfilter_reg0 to wkuppkfilter_reg3, respectively. The wkuppkfilter_reg register is read in a similar way. The MAC updates the wkuppkfilter_reg register current pointer value in RWKPTR field of *PMT control status register (ETH_MACPCSR)*.

Note: *If the Remote wakeup packet filter register (ETH_MACRWKPFRR) is accessed in byte or half-word mode, the internal counter to access the appropriate wkuppkfilter_reg is incremented when the CPU accesses Lane 3.*

When Remote wakeup packet filter register (ETH_MACRWKPFRR) is written, the content is transferred from CSR clock domain to PHY receive clock domain after the write operation. There should not be any further write to the Remote wakeup packet filter register (ETH_MACRWKPFRR) until the first write is updated in PHY receive clock domain. Otherwise, the second write operation does not get updated to the PHY receive clock domain. Therefore, the delay between two write operations to the Remote wakeup packet filter register (ETH_MACRWKPFRR) should be at least 4 cycles of the PHY receive clock.

PMT interrupt

The PMT interrupt signal is asserted when a valid remote wakeup packet is received.

Table 527 lists the remote wakeup scenarios in which PMT interrupt is generated.

Table 527. Remote wakeup packet and PMT interrupt generation⁽¹⁾

Filter i Command			Frame Type and CRC Status		Interrupt Generation
CAST	INV	EN	Received Frame Cast Type	CRC Status	RWK INTR
0	0	1	Unicast	MATCH	Remote Wakeup packet is detected and PMT interrupt is generated
0	1	1	Unicast	MISMATCH	Remote Wakeup packet is detected and PMT interrupt is generated
1	0	1	Multicast	MATCH	Remote Wakeup packet is detected and PMT interrupt is generated
1	1	1	Multicast	MISMATCH	Remote Wakeup packet is detected and PMT interrupt is generated

1. In all other combinations, the Remote Wakeup packet is not detected and PMT interrupt is not generated.

In addition to sbd_intr_o signal, the pmt_intr_o (synchronous to Rx clock) signal is asserted. The pmt_intr_o signal, synchronous to the Rx clock domain, is provided so that the application clock can be stopped by software when the MAC is in the power-down mode.

As the pmt_intr_o signal is generated in the PHY Rx clock domain, it is not cleared immediately when the *PMT control status register (ETH_MACPCSR)* is read. This is because the resultant clear signal has to cross to the PHY Rx clock domain, and then clear

the interrupt source. This delay is at least 4 clock cycles of Rx clock and can be significant when the peripheral is operating in the 10 Mbps mode. When the application clears the PWRDWN bit in *Remote wakeup packet filter register (ETH_MACRWKPFRR)*, the MAC comes out of the power-down mode, but this event does not generate the PMT interrupt.

Power-down sequence

The software must perform the following tasks to initiate the power-down sequence:

- Disable the Transmit DMA (if applicable) by clearing the ST bit of the *Channel i transmit control register (ETH_DMACHiTXCR)*.
- Wait for any previous frame transmissions to complete. You can check this by reading TFCSTS[1:0] and TPESTS bits in *Debug register (ETH_MACDR)* and TXQSTS bit in *Tx queue i debug Register (ETH_MTLTXQiDR)* of all MTL Tx Queues.
- Disable the MAC transmitter and MAC receiver by clearing TE and RE bits in *Operating mode configuration register (ETH_MACCCR)*.
- Wait till the Receive DMA empties all frames from the Rx FIFO. You can check this by reading PRXQ[13:0] in *Rx queue i debug register (ETH_MTLRXQiDR)* of all Rx Queues. If these bits are zero, it indicates that the Rx FIFO is empty.
- Configure the magic packet (MGKPKTEN) and/or remote wake-up (RWKPKTEN) detection in the *PMT control status register (ETH_MACPCSR)*.
- Set bit 31 (ARPEN) in the *Operating mode configuration register (ETH_MACCCR)*.
- Enable the MAC Receiver by setting RE bit and then set PWRDWN bit in the *PMT control status register (ETH_MACPCSR)* to initiate the power-down sequence in MAC.

Note: If the feature is enabled and the MAC Transmitter is in the LPI mode when it is put into the power-down mode, then the GMII or MII interface gets clamped to assert the LPI pattern. If the MAC Transmitter is not in the LPI mode when it is put into the power-down mode, the GMII or MII interface gets clamped to all-zero.

Power-up sequence

The MAC wakes up on receiving the magic packet or remote wake-up frame. The power-up sequence is as follows:

- The MAC asserts pmt_intr_o. When only clock-gating is employed in low-power mode, the pmt_intr_o signal can be used to start the clocks that were gated-off after entering low-power mode.
- The software performs the following tasks:
 - De-assert the pmt_intr_o by reading the *PMT control status register (ETH_MACPCSR)*.
 - Perform a write operation (with reset values) to the *PMT control status register (ETH_MACPCSR)* and the *Remote wakeup packet filter register (ETH_MACRWKPFRR)* so that the corresponding values in the always-on block gets synchronized. Otherwise, the values of these registers are different.
 - Perform write operations to the *Operating mode configuration register (ETH_MACCCR)*, *MAC Address 0 high register (ETH_MACA0HR)* and *MAC Address 0 low register (ETH_MACA0LR)* to synchronize the values in the CSR module and the respective bits in the always-on block. Otherwise, the MAC receiver is on even though the Receive Enable bit is set to 0.

After completing these steps, the software must initialize all registers, enable the transmitter, and program the DMA (in DMA configurations) to resume the normal operation.

64.7.2 Energy Efficient Ethernet (EEE)

EEE is an operational mode that enables the IEEE 802.3 Media Access Control (MAC) sub layer along with a family of physical layers to operate in the Low-Power Idle (LPI) mode. The EEE operational mode supports the IEEE 802.3 MAC operation at 100 Mbps and 1000 Mbps. The peripheral supports the IEEE 802.3az-2010 for EEE.

The LPI mode allows saving power by switching off the parts of the communication device functionality when there is no data to be transmitted and received. The systems on both sides of the link can disable some functionalities to save power during the periods of low-link utilization. The MAC controls whether the system should enter or exit the LPI mode and communicates this to the PHY.

The EEE specifies the capabilities negotiation methods that the link partners can use to determine whether EEE is supported, and then select the set of parameters that are common to both devices.

Transmit path functions

The transmit path functions include tasks that the MAC must perform to make the PHY enter the LPI state.

In the transmit path, the software must set the LPIEN bit of the *LPI control and status register (ETH_MACLCSR)* to indicate to the MAC to stop transmission and initiate the LPI protocol. The MAC completes the transmission in progress, generates its transmission status, and starts transmitting the LPI pattern instead of the IDLE pattern if the link status has been up continuously for a period specified in the LPI LS TIMER LST[9:0] bitfield of *LPI timers control register (ETH_MACLTCR)*. The PHY Link Status PLS bit of the *LPI control and status register (ETH_MACLCSR)* indicates the link status of the PHY.

Note: The EEE feature is not supported when the MAC is configured to use the RMII.

According to the standard (IEEE 802.3az-2010), the PHY must not stop the TxCLK clock during the LPI state in the MII (10 or 100) mode. However, the MAC can stop the GTX_CLK clock during the LPI state in the GMII (1000) mode.

To make the PHY enter the LPI state, the MAC performs the following tasks:

1. De-asserts TX_EN.
2. Asserts TX_ER.
3. Sets TXD[3:0] to 0x1 (for 100 Mbps) or TXD[7:0] to 0x01 (for 1,000 Mbps).
4. Updates the status (TLPIEN bit of *LPI control and status register (ETH_MACLCSR)*) and generates an interrupt.

Note: The MAC maintains the same state of the TX_EN, TX_ER, and TXD signals for the entire duration during which the PHY remains in the LPI state.

To bring the PHY out of the LPI state, that is when the software resets the LPIEN bit, the MAC performs the following tasks:

1. Stops transmitting the LPI pattern and starts transmitting the IDLE pattern.
2. Starts the LPI TW TIMER:

The MAC cannot start the transmission until the wakeup time specified for the PHY expires. The auto-negotiated wake-up interval is programmed in the TWT field of the *LPI timers control register (ETH_MACLTCR)*.

3. Updates the LPI exit status (TLPIEX bit of the *LPI control and status register (ETH_MACLCSR)*) and generates an interrupt.

Figure 806 shows the behavior of TX_EN, TX_ER, and TXD[3:0] signals during the LPI mode transitions.

Note: The MAC does not stop the TX_CLK clock. The application can stop this clock (as shown in Figure 806) if the PHY supports it and when the MAC sets the `sbd_tx_clk_gating_ctrl_o` signal to 1. The `sbd_tx_clk_gating_ctrl_o` signal is asserted after nine Tx Clock Cycles, one Pulse Synchronizer delay, and one CSR clock cycle. The assertion of the `sbd_tx_clk_gating_ctrl_o` signal depends on the LPITCSE bit of the LPI control and status register (ETH_MACLCSR) and can be done automatically as shown on Figure 807.

If RGMII Interface is selected, the Tx clock is required for transmitting the LPI pattern and so the Tx Clock cannot be gated.

If the MAC is in the Tx LPI mode and the Tx clock is stopped, the application should not write to CSR registers that are synchronized to Tx clock domain.

If the MAC is in the LPI mode and the application issues a soft reset or hard reset, the MAC transmitter comes out of the LPI mode.

Figure 806. LPI transitions (Transmit, 100 Mbps)

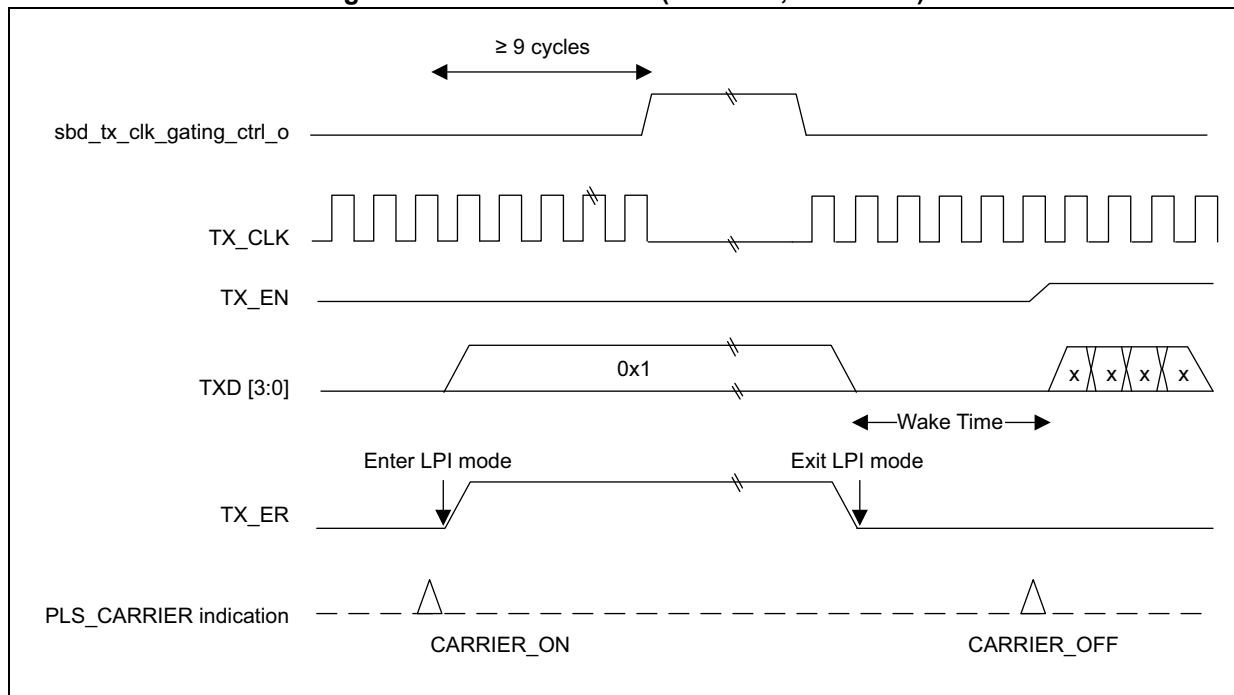

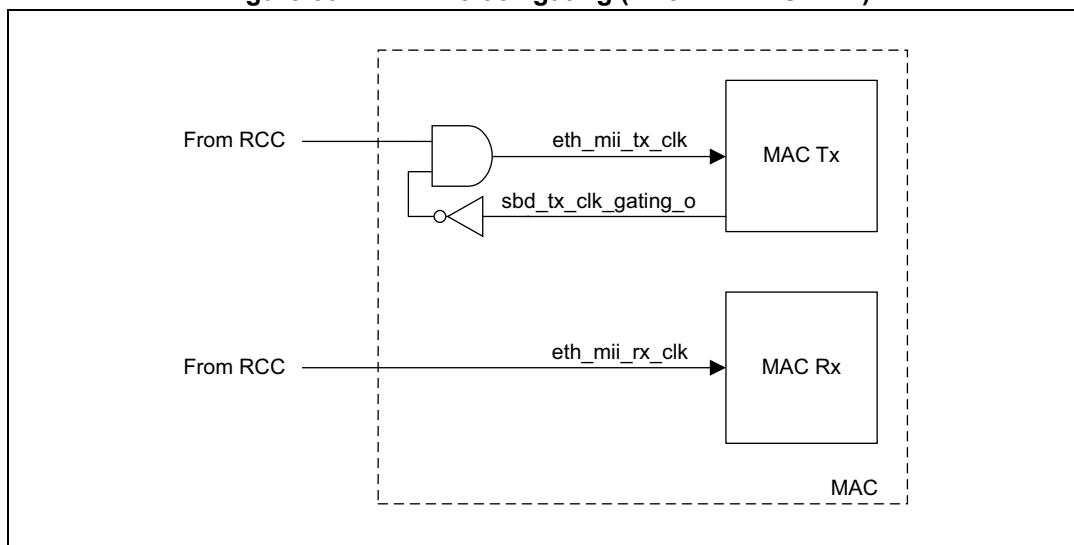

Figure 807. LPI Tx clock gating (when LPITCSE = 1)

Automated entry/exit from LPI mode in transmit path

The MAC transmitter can be programmed to enter and exit LPI Idle mode automatically based on whether it is Idle for a specific period of time or has a packet to transfer. These modes are enabled and controlled by the [LPI control and status register \(ETH_MACLCSR\)](#).

When LPITXA and LPIEN of [LPI control and status register \(ETH_MACLCSR\)](#) are set, the MAC transmitter enters LPI Idle state when the MAC transmit path (including the MTL layers and DMA layers) are idle. The MAC transmitter exits the LPI Idle state and clears the LPITXEN bit as soon as any of functions in the TX path (DMA, MTL or MAC) becomes non-idle due to initiation of a packet transfer.

In addition, when LPITE is also set, the MAC transmitter enters LPI Idle state only if the Transmit path remains in idle state (no activity) for the time period indicated by the value in [LPI entry timer register \(ETH_MACLETR\)](#). In this mode also, the MAC transmitter exits the LPI Idle state as soon as any of the functions becomes non-idle. However, the LPIEN bit is not cleared but remains active so that reentry to LPI Idle state is possible without any software intervention when the MAC becomes idle again.

When both LPITE and LPITXA bits are cleared, the application can directly control the entry and exit of LPI Idle state by programming the LPIEN bit.

Receive path Functions

The receive path functions include the tasks that the PHY and MAC must perform when the PHY receives signals from the link partner to exit the LPI state.

In the receive path, when the PHY receives the signals from the link partner to enter into the LPI state, the PHY and MAC perform the following tasks:

1. The PHY asserts RX_ER.
2. The PHY sets RXD[3:0] to 0x1 (for 100 Mbps) or RXD[7:0] to 0x01 (for 1,000 Mbps).
3. The PHY de-asserts RX_DV.
4. The MAC updates the RLPIEN bit of the [LPI control and status register \(ETH_MACLCSR\)](#) and immediately generates an interrupt.

Note: The PHY maintains the same state of the RX_ER, RXD, and RX_DV signals for the entire duration during which it remains in the LPI state.

If the LPI pattern is detected for a very short duration (that is, less than two cycles of Rx clock), the MAC does not enter the Rx LPI mode.

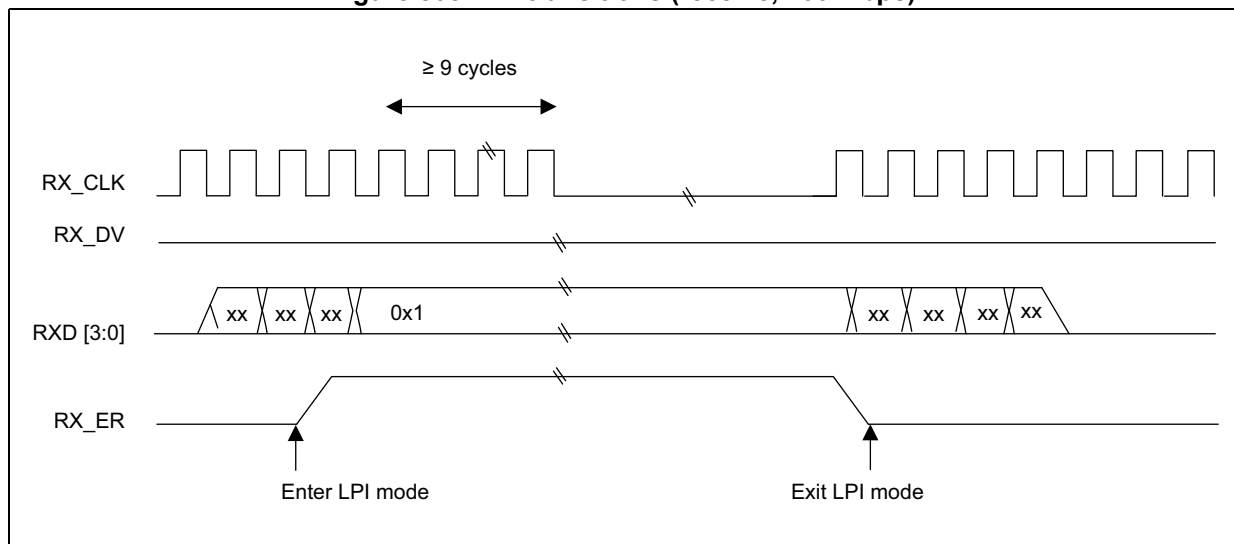

If the duration between the end of the current Rx LPI pattern and the start of the next Rx LPI pattern is very short (that is, less than two Rx clock cycles), then the MAC exits and enters again the Rx LPI mode. The MAC does not trigger the Rx LPI Exit and Entry interrupts.

When the PHY receives signals from the link partner to exit the LPI state, the PHY and MAC perform the following tasks:

1. The PHY de-asserts RX_ER and returns to a normal inter-packet state.
2. The MAC updates the RLPIEX bit of the [LPI control and status register \(ETH_MACLCSR\)](#) and generates an interrupt immediately. The sideband signal lpi_intr_o (synchronous to Rx clock) is also asserted.

[Figure 808](#) shows the behavior of RX_ER, RX_DV, and RXD[3:0] signals during the LPI mode transitions.

Figure 808. LPI transitions (receive, 100 Mbps)

Note: If the RX_CLK_stoppable bit (in the PHY register written through MDIO) is asserted when the PHY is indicating LPI to the MAC, the PHY may halt the RX_CLK at any time more than nine clock cycles after the start of the LPI state as shown in [Figure 808](#).

If the MAC is in LPI mode and the application issues a soft reset or hard reset, the MAC receiver exits from LPI mode during reset. If the LPI pattern is still received after the reset is de-asserted, the MAC receiver enters again the LPI state.

If the RX clock is stopped in the RX LPI mode, the application should not write to the CSR registers that are being synchronized to the RX clock domain.

When the PHY sends the LPI pattern, if EEE feature is enabled, the MAC automatically enters the LPI state. There is no software control to prevent the MAC from entering the LPI state.

LPI timers

The transmitter maintains the LPI LS TIMER, LPI TW TIMER, and LPI AUTO ENTRY TIMER timers.

The following LPI timers are loaded with the respective values from the *LPI timers control register (ETH_MACLTCR)* and *LPI entry timer register (ETH_MACLETR)*:

- LPI LS TIMER

The LPI LS TIMER counts, in milliseconds, the time expired since the link status is up. You can enable the monitoring of the LUD bit of the *PHYIF control status register (ETH_MACPHYCSR)* by setting the PLS bit of *LPI control and status register (ETH_MACLCSR)*.

The link status is indicated to the MAC by the LNKSTS bit of the *PHYIF control status register (ETH_MACPHYCSR)* or the value programmed by the software in the PLS bit of the *LPI control and status register (ETH_MACLCSR)*. If the link status is not available in the *PHYIF control status register (ETH_MACPHYCSR)*, the software should get the PHY link status by reading the PHY register and accordingly update the PLS bit.

This timer is cleared every time the link goes down. It starts to increment when the link is up again and continues to increment until the value of the timer becomes equal to the terminal count. Once the terminal count is reached, the timer remains at the same value as long as the link is up. The terminal count is the value programmed in the LST[9:0] bitfield in the *LPI timers control register (ETH_MACLTCR)*. The GMII interface does not assert the LPI pattern unless the terminal count is reached. This ensures a minimum time for which no LPI pattern is asserted after a link is established with the remote station. This period is defined as 1 second in the IEEE 802.3-az-2010. The LPI LS TIMER is 10-bit wide. The software can program up to 1023 milliseconds.

- LPI TW TIMER

The LPI TW TIMER counts, in microseconds, the time expired since the de-assertion of LPI. The terminal count should be programmed in Bit[15:0] of *LPI timers control register (ETH_MACLTCR)*. The terminal count of the timer is the value of resolved Transmit TW that is the auto-negotiated time after which the MAC can resume the normal transmit operation. After exiting the LPI mode, the MAC resumes its normal operation after the TW timer reaches the terminal count.

The MAC supports the LPI TW TIMER in units of microsecond. The LPI TW TIMER is 16-bit wide. Therefore, the software can program up to 65535 micro seconds.

- LPI AUTO ENTRY TIMER

This timer counts in steps of eight microseconds, the time for which the MAC transmit path has to remain in idle state (no activity), before the MAC Transmitter enters the LPI IDLE state and starts transmitting the LPI pattern. This timer is enabled when LPITE bit in *LPI control and status register (ETH_MACLCSR)* is set.

Note: Program the PLS bit of *LPI control and status register (ETH_MACLCSR)* to 1'b0 before switching between the GMII and MII modes. This resets the internal timers. If the mode is changed after the LPI LS TIMER or LPI TW TIMER starts, the change in the Tx clock frequency can result in incorrect timeout.

LPI interrupt

The MAC generates the LPI interrupt when the Tx or Rx side enters or exits the LPI state. The interrupt `sbd_intr_o` is asserted when the LPI interrupt status is set. The LPI interrupt can be cleared by reading the *LPI control and status register (ETH_MACLCSR)*.

When the MAC exits the Rx LPI state, then in addition to the `sbd_intr_o`, the sideband signal `lpi_intr_o` (synchronous to Rx clock) is asserted. The `lpi_intr_o` signal can be used to trigger the external clock-gating circuitry to restore the application clock to the MAC. The `lpi_intr_o` signal, synchronous to the Rx clock domain, is provided so that the application clock can be stopped by software when the MAC is in the LPI state.

The `lpi_intr_o` signal is generated in the Rx clock domain. It may not be cleared immediately after the [LPI control and status register \(ETH_MACLCSR\)](#) is read. This is because the clear signal, generated in CSR clock domain, has to cross the Rx clock domain, and then clear the interrupt source. This delay is at least four clock cycles of Rx clock and can be significant when the peripheral is operating in the 10 Mbps mode.

Programming guidelines for Energy Efficient Ethernet

For detailed guidelines on the programming guidelines, see [Section 64.9.13: Programming guidelines for Energy Efficient Ethernet \(EEE\) on page 3447](#).

64.8 Ethernet interrupts

The Ethernet peripheral generates a single interrupt signal (`eth_sbd_intr_it`). This signal can be raised as a result of various events. These events are captured in status registers and interrupt enables are provided for each source of interrupt such that the interrupt signal is asserted for an event only when the corresponding interrupt enable is set.

The interrupt status and corresponding enable registers are organized in a hierarchical manner so that it is easier for software to traverse and identify the source of interrupt event quickly. When interrupt is asserted, the *Interrupt status register (ETH_DMAISR)* register is first level that indicates the major blocks for the interrupt event source. This register is read-only, and it contains bits corresponding to each DMA channel (TX & RX pair), the MTL, and the MAC. The software application must then read one (or more) of the following registers corresponding to the bits that are set:

- ETH_DMAC0SR: Channel 0 Status (see *Channel i status register (ETH_DMACiSR)*)
- ETH_DMAC1SR: Channel 1 Status (see *Channel i status register (ETH_DMACiSR)*)
- ETH_MTLISR: Interrupt Status (see *Interrupt status Register (ETH_MTLISR)*)
- ETH_MACISR: Interrupt Status (see *Interrupt status register (ETH_MACISR)*)

64.8.1 DMA interrupts

Interrupt registers description

The ETH_DMAC0SR: Channel 0 Status register (see *Channel i status register (ETH_DMACiSR)*) captures all the interrupt events of that TxDMA and RxDMA channel. The ETH_DMAC0IER: Channel 0 Interrupt Enable register (see *Channel i interrupt enable register (ETH_DMACiIER)*) contains the corresponding enable bits for each of the interrupt event.

There are two groups of interrupts in the DMA channel namely Normal and Abnormal interrupts. They are indicated by Bits[15:14] of ETH_DMAC0SR register respectively. The normal group is for events that happen during the normal transfer of packets (TI: transmit interrupt, RI: receive interrupt, TBU: Transmit buffer unavailable) while the abnormal interrupt events are for error events.

Interrupts are not queued. If the same interrupt event occurs again before the driver responds to the previous one, no additional interrupts are generated. An interrupt is generated only once for multiple events. The driver must scan the *Interrupt status register (ETH_DMAISR)* for the cause of the interrupt and clear the source in the respective Status register. The interrupt is cleared only when all the bits of *Interrupt status register (ETH_DMAISR)* are cleared.

Periodic scheduling of Transmit and Receive Interrupt

It is not preferable to generate interrupts for every packet transferred by DMA (RI and TI) for system throughput performance reasons. The Ethernet peripheral gives the flexibility to schedule the interrupt at regular intervals using two methods:

1. Set Interrupt on Completion bit in Transmit descriptor (TDES2[31] in *Table 531: TDES2 normal descriptor (read format)*) once for every "required" number of packets to be transmitted.
2. Similarly, set the IOC (RDES3[30] in *Table 544: RDES3 normal descriptor (read format)*) bit only at some specific intervals of Receive descriptors. This way, whenever

a received packet transfer to system memory is complete and any of the descriptors used for that packet transfer has the IOC bit set, only then the RI event is generated.

In addition to above, an interrupt timer (ETH_DMACH0RXIWTR: Channel 0 Rx Interrupt Watchdog Timer) is given for flexible control and periodic scheduling of Receive Interrupt. When this interrupt timer is programmed with a nonzero value, it gets activated as soon as the Rx DMA completes a transfer of a received packet to system memory without asserting the Receive Interrupt because the corresponding interrupt of completion IOC bit (RDES3[30] in [Table 544: RDES3 normal descriptor \(read format\)](#)) is not set. When this timer runs out as per the programmed value, RI bit is set and the interrupt is asserted if the corresponding RIE is enabled in ETH_DMACH0IER register (see [Channel i interrupt enable register \(ETH_DMACHiIER\)](#)). The timer is stopped and cleared before it expires, if the RI is set for a packet transfer whose descriptor's IOC was set. The timer is reactivated automatically after the next packet transfer is complete without the RI event being generated.

Per channel transfer complete interrupt

The Transmit Transfer complete interrupt (TI) and Receive Transfer complete interrupt (RI) is reflected in the Channel Status register ([Channel i status register \(ETH_DMACHiSR\)](#)). The TI bit is set whenever the Tx DMA channel closes the descriptor in which the IOC bit is set (Interrupt On Completion - TDES2[31]). Similarly, the RI bit is set whenever the Rx DMA channel closes the descriptor with the LD bit set and, in any of the descriptors used for transferring that packet, IOC bit is set (Interrupt Enable on completion - RDES3[30]).

The interrupt signal is asserted for the Transfer complete interrupts only when the corresponding interrupts are enabled in the channel interrupt enable register ([Channel i interrupt enable register \(ETH_DMACHiIER\)](#)).

The behavior of the RI/TI interrupts changes depending on the settings of INTM field (bits[17:16]) in the ETH_DMAMR register ([DMA mode register \(ETH_DMAMR\)](#)). [Table 528](#) explains the behavior of the Transfer Complete interrupt.

Table 528. Transfer complete interrupt behavior

Interrupt mode	Behavior of TI/RI and eth_sbd_intr_it
INTM=0	The TI/RI status signals are set whenever the Transfer complete event is detected. The bits get cleared whenever the software driver writes 1 to these bits. The eth_sbd_intr_it is asserted whenever the corresponding interrupts are also enabled in ETH_DMACHiIER register.
INTM=1	The TI/RI is set as explained above. However, the eth_sbd_intr_it is not asserted for any RI/TI events.
INTM=2	The RI/TI status bits are set whenever the Transfer Complete event is detected and gets reset whenever software driver clears those bits by writing 1. However, if another Transfer Complete event is detected before it is cleared (serviced) by the software, these status bits is automatically set again. However, the eth_sbd_intr_it is not generated based on TI/RI.

64.8.2 MTL interrupts

MTL interrupt events are combined with the events in the DMA to generate the interrupt signal.

The register *Interrupt status Register (ETH_MTLISR)* report the queue number responsible for the event. ETH_MTLQ0ICSR: Queue 0 Interrupt Control Status or ETH_MTLQ1ICSR: Queue 1 Interrupt Control Status must be read for event description.

The MTL interrupts are enabled by default. Each event can be prevented from asserting the interrupt by setting the corresponding mask bits in the *Interrupt status Register (ETH_MTLISR)* register.

MTL interrupt signal is driven by one of these events on Queue 0 and Queue 1:

- Receive Queue Overflow Interrupt
- Transmit Queue Underflow

64.8.3 MAC Interrupts

MAC interrupt events are combined with the events in the DMA to generate the interrupt signal.

The MAC interrupts are of level type, that is, the interrupt remains asserted (high) until it is cleared by the application or software.

The *Interrupt status register (ETH_MACISR)* describes the events that can cause an interrupt from the MAC. The MAC interrupts are enabled by default. Each event can be prevented from asserting the interrupt by setting the corresponding mask bits in the *Interrupt status register (ETH_MACISR)*.

The interrupt register bits only indicate the block from which the event is reported. You must read the corresponding status registers and other registers to clear the interrupt.

MAC interrupt signal is driven by one of these events:

- Receive Status Interrupt
- Transmit Status Interrupt
- Timestamp Interrupt Status
- MMC Interrupt Status
 - MMC Receive Checksum Offload Interrupt Status
 - MMC Transmit Interrupt Status
 - MMC Receive Interrupt Status
- LPI Interrupt Status
- PMT Interrupt Status
- PHY Interrupt
- RGMII Interrupt Status

Note: Two sidebands signals are generated together with LPI and PMT interrupts: *lpi_intr_o* and *pmt_intr_o*. They are used for wakeup event detection at EXTI level.

64.9 Ethernet programming model

This chapter provides the instructions for initializing the DMA or MAC registers in the proper sequence. It contains the following sections:

- DMA initialization (see [Section 64.9.1](#))
- MTL initialization (see [Section 64.9.2](#))
- MAC initialization (see [Section 64.9.3](#))
- Performing Normal Receive and Transmit Operation (see [Section 64.9.4](#))
- Stopping and Starting Transmission (see [Section 64.9.5](#))
- Programming Guidelines for multichannel multiqueue operation (see [Section 64.9.8](#))
- Programming Guidelines for GMII Link State Transitions (see [Section 64.9.9](#))
- Programming Guidelines for IEEE 1588 Timestamping (see [Section 64.9.10](#))
- Programming Guidelines for AV Feature (see [Section 64.9.12](#))
- Programming Guidelines for Energy Efficient Ethernet (see [Section 64.9.13](#))
- Programming Guidelines for flexible pulse-per-second (PPS) output (see [Section 64.9.14](#))
- Programming Guidelines for TSO (see [Section 64.9.15](#))
- Programming Guidelines for VLAN filtering on Receive (see [Section 64.9.16](#))

64.9.1 DMA initialization

Complete the following steps to initialize the DMA:

1. Provide a software reset to reset all MAC internal registers and logic (bit 0 of [DMA mode register \(ETH_DMAMR\)](#)).
2. Wait for the completion of the reset process (poll bit 0 of the [DMA mode register \(ETH_DMAMR\)](#), which is cleared when the reset operation is completed).
3. Program the following fields to initialize the [System bus mode register \(ETH_DMASBMR\)](#):
 - a) AAL
 - b) Fixed burst or undefined burst
 - c) Outstanding requests limit value (OSR_LMT).
 - d) If fixed length value is enabled, select the maximum burst length possible on the AXI Bus (bits [7:1])
4. Create a transmit and a receive descriptor list. In addition, ensure that the receive descriptors are owned by the DMA (set bit 31 of TDES3/RDES3 descriptor). For more information on descriptors, refer to [Section 64.10: Descriptors](#).

Note: Descriptor address from start to end of the ring should not cross the 4GB boundary.

5. Program ETH_DMACH0TXRLR and ETH_DMACH0RXRLR registers (see [Channel i Tx descriptor ring length register \(ETH_DMACHiTXRLR\)](#) and [Channel 0 Rx descriptor ring length register \(ETH_DMACH0RXRLR\)](#)). The programmed ring length must be at least 4.
6. Initialize receive and transmit descriptor list address with the base address of transmit and receive descriptor ([Channel i Tx descriptor list address register \(ETH_DMACHiTXDLAR\)](#), [Channel 0 Rx descriptor list address register \(ETH_DMACH0RXDLAR\)](#)). In addition, program the transmit and receive tail pointer registers that inform the DMA about the available descriptors (see [Channel i Tx](#)

descriptor tail pointer register (ETH_DMACiXDTPR) and Channel 0 Rx descriptor tail pointer register (ETH_DMAC0RXDTPR).

7. Program ETH_DMAC0CR, ETH_DMAC0TXCR and ETH_DMAC0RXCR registers (see *Channel i control register (ETH_DMACiCR)*, *Channel i transmit control register (ETH_DMACiTXCR)* and *Channel 0 receive control register (ETH_DMAC0RXCR)*) to configure the parameters such as the maximum burst-length (PBL) initiated by the DMA, descriptor skip lengths, OSP for TxDMA, RBSZ[13:0] for RxDMA, and so on.
8. Enable the interrupts by programming the ETH_DMAC0IER register (see *Channel i interrupt enable register (ETH_DMACiIER)*).
9. Start the Receive and Transmit DMAs by setting SR (bit 0) of *Channel 0 receive control register (ETH_DMAC0RXCR)* and ST (bit 0) of the ETH_DMAC0TXCR (see *Channel i transmit control register (ETH_DMACiTXCR)*).
10. Repeat steps 4 to 9 for all the Tx DMA channels selected in the hardware.

64.9.2 MTL initialization

Complete the following steps to initialize the MTL registers:

1. Program the Tx Scheduling (SCHALG) and Receive Arbitration Algorithm (RAA) fields in *Operating mode Register (ETH_MTL0MR)* to initialize the MTL operation when multiple Tx and Rx queues are used.
2. Program the following fields to initialize the operating mode in *Tx queue i operating mode Register (ETH_MTLTXQiOMR)*.
 - a) Transmit Store And Forward (TSF) or Transmit Threshold Control (TTC) if the Threshold mode is used.
 - b) Transmit Queue Enable (TXQEN) to value 2'b10 to enable Transmit Queue 0.
 - c) Transmit Queue Size (TQS).
3. Program the following fields to initialize the operating mode in the ETH_MTLRXQiOMR register (see *Rx queue i operating mode register (ETH_MTLRXQiOMR)*):
 - a) Receive Store and Forward (RSF) or RTC if Threshold mode is used.
 - b) Flow Control Activation and De-activation thresholds for MTL Receive FIFO (RFA and RFD).
 - c) Error Packet and undersized good Packet forwarding enable (FEP and FUP).
 - d) Receive Queue Size (RQS).
4. Repeat the previous two steps for all the MTL Tx and Rx queues selected in the configuration

64.9.3 MAC initialization

The MAC configuration registers establish the operating mode of the MAC. If possible, these registers must be initialized before initializing the DMA. The following MAC Initialization operations can also be performed after DMA initialization. If the MAC initialization is complete before the DMA is configured, enable the MAC receiver (last step in the following sequence) only after the DMA is active. Otherwise, received frames fill the Rx FIFO and overflow.

1. Provide the MAC address registers: *MAC Address x low register (ETH_MACAxLR)*, *MAC Address 0 high register (ETH_MACA0HR)* and *MAC Address x high register (ETH_MACAxHR)*.
2. Program the following fields to set the appropriate filters for the incoming frames in the *Packet filtering control register (ETH_MACPFR)*:
 - a) Receive All.
 - b) Promiscuous mode.
 - c) Hash or Perfect Filter.
 - d) Unicast, multicast, broadcast, and control frames filter settings.
3. Program the following fields for proper flow control in the *Tx Queue 0 flow control register (ETH_MACQ0TXFCR)*:
 - a) Pause time and other Pause frame control bits.
 - b) Transmit Flow control bits.
 - c) Flow Control Busy.
4. Program the *Interrupt enable register (ETH_MACIER)* as required, if it is applicable for your configuration.
5. Program the appropriate fields in the *Operating mode configuration register (ETH_MACCCR)* register. For example, Inter-packet gap while transmission and jabber disable.
6. Set bit 0 and 1 in *Operating mode configuration register (ETH_MACCCR)* register to start the MAC transmitter and receiver.

To support Jumbo Transmit/Receive packets, follow these steps:

- In the *Operating mode configuration register (ETH_MACCCR)*
 - a) Set JE bit to 1.
 - b) Set JD and WD bits to 0 to avoid giant packet error reporting.
 - c) Set GPSLCE bit to 1
 - d) Set GPSL bitfield of the *Extended operating mode configuration register (ETH_MACECR)* to a value > 9026

To support Transmit/Receive packets, up to 16K, follow these steps:

- In the *Operating mode configuration register (ETH_MACCCR)*
 - a) Set JD and WD bits to 1 to avoid giant packet error reporting.
 - b) Set GPSLCE bit to 1.
 - c) Set GPSL bitfield of the *Extended operating mode configuration register (ETH_MACECR)* to 16383.

64.9.4 Performing normal receive and transmit operation

For normal operation, complete the following steps:

1. For normal transmit and receive interrupts, read the interrupt status. Then, poll the descriptor by reading the status of the descriptor owned by the Host (either transmit or receive).
2. Set the descriptors to appropriate values. Make sure that transmit and receive descriptors are owned by the DMA to resume the transmission and reception of data.
3. If the descriptors are not owned by the DMA (or no descriptor is available), the DMA goes into Suspend state. The transmission or reception can be resumed by freeing the

descriptors and writing the ETH_DMAC0TXDTPR (see [Channel i Tx descriptor tail pointer register \(ETH_DMACiTXDTPR\)](#) and ETH_DMAC0RXDTPR (see [Channel 0 Rx descriptor tail pointer register \(ETH_DMAC0RXDTPR\)](#)).

4. In debug mode, the values of the current host transmitter or receiver descriptor address pointer can be read in ETH_DMAC0CATXDR and ETH_DMAC0CARXDR registers (see [Channel i current application transmit descriptor register \(ETH_DMACiCATXDR\)](#) and [Channel 0 current application receive descriptor register \(ETH_DMAC0CARXDR\)](#)).
5. In debug mode, the values of the current host transmit buffer address pointer and receive buffer address pointer can be read in ETH_DMAC0CATXDR and ETH_DMAC0CARXDR registers (see [Channel i current application transmit descriptor register \(ETH_DMACiCATXDR\)](#) and [Channel 0 current application receive descriptor register \(ETH_DMAC0CARXDR\)](#)).

64.9.5 Stopping and starting transmission

Complete the following steps to pause the transmission for some time:

1. Disable the Transmit DMA (if applicable) by clearing Bit 0 (ST) of ETH_DMAC0TXCR register (see [Channel i transmit control register \(ETH_DMACiTXCR\)](#)).
2. Wait for any previous frame transmissions to complete. You can check this by reading the appropriate bits of [Tx queue i debug Register \(ETH_MTLTXQiDR\)](#) (TRCSTS[1:0] is not 01 and TXQSTS = 0).
3. Disable the MAC transmitter and MAC receiver by clearing RE and TE bits of the [Operating mode configuration register \(ETH_MACCR\)](#) Register.
4. Disable the Receive DMA (if applicable), after making sure that the data in the Rx FIFO is transferred to the system memory (by reading the appropriate bits of [Tx queue i debug Register \(ETH_MTLTXQiDR\)](#), PRXQ=0 and RXQSTS[1:0] = 00).
5. Make sure that both Tx queue and Rx queue are empty (TXQSTS is 0 in [Tx queue i debug Register \(ETH_MTLTXQiDR\)](#) and RXQSTS[1:0] is set to 00).
6. To restart the operation, first start the DMAs, and then enable the MAC Transmitter and Receiver.

Note: Do not change the configuration (such as duplex mode, speed, port, or loopback) when the MAC is actively transmitting or receiving. These parameters are changed by software only when the MAC transmitter and receiver are not active.

Similarly, do not change the DMA-related configuration when Transmit and Receive DMA are active.

64.9.6 Programming guidelines for switching to new descriptor list in RxDMA

Switching to a new descriptor list is different in the Rx DMA compared to the Tx DMA. Switching to a new descriptor list is permitted when the RxDMA is in Suspend state, as explained below:

- Generally, RxDMA prepares the descriptors in advance.
- If the RxDMA goes to Suspend state due to descriptors not being available, a major failure occurs (software is not able to free the filled-up descriptors/buffers). If this issue is not rectified immediately, frames are lost because of an Rx FIFO overflow. Therefore, the software is allowed to create a new descriptor list and program the RxDMA to start using it immediately, without going into Stop state.

64.9.7 Programming guidelines for switching the AXI clock frequency

To dynamically change the AXI clock frequency (without applying soft reset or hard reset), follow these steps:

1. Disable the Transmit DMA (if applicable) and wait for any previous frame transmissions to complete. When the frame transmissions is complete, the Tx FIFO becomes empty and the Tx DMA enters Stop state. The Tx FIFO status is given in the *Tx queue i debug Register (ETH_MTLTXQiDR)* and the status of DMA is given in *Debug status register (ETH_DMADSR)*.
2. Disable the MAC transmitter and the MAC receiver by clearing the appropriate bits in *Operating mode configuration register (ETH_MACCR)*.
3. Disable the Receive DMA (if applicable) after making sure that the data in the Rx FIFO is transferred to the system memory. The Rx FIFO empty status is given in *Rx queue i debug register (ETH_MTLRXQiDR)*.
4. Ensure that the application does not perform any register read or write operation.
5. Change the frequency of the AXI clock.
6. Enable the MAC Transmitter or the MAC Receiver and the Transmit or Receive DMA. These steps ensure that no valid data is present in the Tx FIFO or Rx FIFO at the time of clock frequency switching and prevent any data corruption.

64.9.8 Programming guidelines for multichannel multiqueue operation

Transmit path

1. Program the Transmit queue size in the TQS field in ETH_MTLTXQiOMR register. The size of the queue is determined by the value programmed in the TQS field.
During the Transmit operation, the number of channels is equal to the number of the queues. As a result, the channel to queue mapping is fixed.
2. To use a queue, the queue must be enabled by setting the TXQEN bit in the corresponding ETH_MTLTXQiOMR register. The ST bit in *Channel i transmit control register (ETH_DMACiTXCR)* and the corresponding TXQEN bit in ETH_MTLTXQiOMR register must be enabled.
3. Program the scheduling method in SCHALG bit of ETH_MTLQMR register.
4. If CBS algorithm is enabled on AV queue 1, ETH_MTLTXQ1ECR, ETH_MTLTXQ1SSCR, ETH_MTLTXQ1HCR and ETH_MTLTXQ1LCR registers also need to be programmed as required.

Receive path

1. Program the Receive queue size in the RQS field in ETH_MTLRXQiOMR register. The size of the queue is determined by the value programmed in the RQS field.
2. Enable the Receive queues 0 to 1 in the RXQ0EN to RXQ1EN fields of ETH_MACRXQ0CR register for AV.
Enable SR bit of statically or dynamically mapped *Channel 0 receive control register (ETH_DMAC0RXCR)* and corresponding RXQiEN in *Rx queue control 0 register (ETH_MACRXQC0R)*.
3. The MAC routes the Rx packets to the Rx queues depending on following packet types:
 - a) AV PTP packets are routed according to the value of PTPQ in ETH_MACRXQC1R register

- b) AV untagged control packets are routed according to the value of AVCPQ in ETH_MACRXQC1R register.
- c) VLAN tag priority field in VLAN tagged packets
Program PSRQ1 and PSRQ0 of the ETH_MACRXQC2R register to configure the routing of tagged packets based on the USP (user priority) field of the received packets to the Rx queues 0 to 1.
- d) The AV tagged control and data packets are also routed according to PSRQ field of the ETH_MACRXQC2R register.

Note: The priorities set in PSRQ0 and PSRQ1 must be unique.

Programming guidelines for recovering from DMA channel failure

When the DMA channel issues a bus error, follow the steps described below to recover from the failure.

Recovering from the receive DMA channel failure

Follow these steps if a bus error occurred in the Receive DMA channel:

1. Set the RPF bit to 1. This flushes all the packets one after the other. This step is optional. However, setting this bit prevents HOL (head-of-line) blocking in the Rx queues when packets sent to the RXDMA are stopped due to bus error.
2. Reprogram the specific registers of the DMA channel.
3. Start the DMA channel.

Recovering from the transmit DMA channel failure

1. Stop the specific DMA channel, even if it is in active state.
2. Flush the corresponding MTL queue.
3. Reprogram the specific registers of the DMA channel.
4. Start the DMA channel.

Note: Due to the known limitations, reprogramming the DMA channel registers might not always be successful to recover from a bus error. If the peripheral is not fully functional after reprogramming the DMA, as a workaround, issue a soft reset to recover from the bus error.

Programming guidelines for disabling receive queue

Follow these steps to disable specific receive queue:

1. Disable the receiver by setting the RE bit of the [Operating mode configuration register \(ETH_MACCCR\)](#) to 0.
2. Read the [Debug register \(ETH_MACDR\)](#) (ensure that RPESTS and RFCFCSTS fields are 0) and [Rx queue i debug register \(ETH_MTLRXQiDR\)](#) of all the Rx queues.
3. When all [Rx queue i debug register \(ETH_MTLRXQiDR\)](#) are read as 0, disable the intended Rx queue by programming the corresponding fields in the [Rx queue control 0 register \(ETH_MACRXQC0R\)](#).
4. Enable the receiver by setting the RE bit of [Operating mode configuration register \(ETH_MACCCR\)](#) to 1.

64.9.9 Programming guidelines for GMII link state transitions

Transmit and Receive clocks are running when the link is down

Complete the following steps when the link is down while the Transmit and Receive clocks are running:

1. Disable the Transmit DMA (if applicable) by clearing bit 0 (ST) of *Channel i control register (ETH_DMACiCR)*.
2. Disable the MAC receiver by clearing RE bit of *Operating mode configuration register (ETH_MACCR)*.
3. Wait for any previous frame transmissions to complete. You can check this by reading the appropriate bits of *Tx queue i debug Register (ETH_MTLTXQiDR)* (TRCSTS[1:0] is not 01).
or
Flush the Tx FIFO for faster empty operation.
4. Disable the MAC transmitter by clearing TE bit of the *Operating mode configuration register (ETH_MACCR)* Register.
5. Make sure that both Tx and Rx queues are empty (TXQSTS is set to 0 in *Tx queue i debug Register (ETH_MTLTXQiDR)* and RXQSTS[1:0] to 00 in *Rx queue i debug register (ETH_MTLRXQiDR)*).
6. After the link is up, read the PHY registers to identify the latest configuration and program the MAC registers accordingly.
7. Restart the operation by starting the Tx DMA. Then enable the MAC Transmitter and Receiver.

The Rx DMA does not need to be enabled: since the Receiver is disabled, there are no data in the Rx FIFO.

Transmit and Receive clocks are stopped when the link is down

Complete the following steps when the link is down and the Transmit and Receive clocks are stopped:

1. Disable the MAC Transmitter and Receiver by clearing RE and TE bits in the *Operating mode configuration register (ETH_MACCR)*. This does not take immediate effect as the clocks are absent.
2. Wait till the link is up and the clocks are restored.
3. Wait until the transfer of any partial frame is complete if any was ongoing when the Transmit/Receive clock is stopped. This can be checked by reading the *Debug register (ETH_MACDR)* (all bits should be set to 0). Some old packets may still remain in the TXFIFO as the MAC Transmitter is stopped.
4. Read the PHY registers to identify the latest operating mode and program the MAC registers accordingly.
5. Restart the MAC Transmitter and Receiver by setting RE and TE bits.

64.9.10 Programming guidelines for IEEE 1588 timestamping

Initializing the System time generation

The timestamp feature can be enabled by setting bit 0 of the *Timestamp control Register (ETH_MACTSCR)*. However, it is essential that the timestamp counter is initialized after this bit is set. Complete the following steps to perform the peripheral initialization:

1. Mask the Timestamp Trigger interrupt by clearing bit 12 of *Interrupt enable register (ETH_MACIER)*.
2. Set bit 0 of *Timestamp control Register (ETH_MACTSCR)* to enable timestamping.
3. Program *Subsecond increment register (ETH_MACSSIR)* based on the PTP clock frequency.
4. If you use the Fine Correction method, program *Timestamp addend register (ETH_MACTSAR)* and set bit 5 of *Timestamp control Register (ETH_MACTSCR)*.
5. Poll the *Timestamp control Register (ETH_MACTSCR)* until bit 5 is cleared.
6. Program bit 1 of *Timestamp control Register (ETH_MACTSCR)* to select the Fine Update method (if required).
7. Program *System time seconds update register (ETH_MACSTSUR)* and *System time nanoseconds update register (ETH_MACSTNUR)* with the appropriate time value.
8. Set bit 2 in *Timestamp control Register (ETH_MACTSCR)*.

The timestamp counter starts as soon as it is initialized with the value written in the timestamp update registers. If one-step timestamping is required:

- a) Enable one-step timestamping by programming bit 27 of the TDES3 Context Descriptor.
 - b) Program *Timestamp Ingress asymmetric correction register (ETH_MACTSIACR)* to update the correction field in PDelay_Req PTP messages.
9. Enable the MAC receiver and transmitter for proper timestamping.

Note: If timestamp operation is disabled by clearing bit 0 of *Timestamp control Register (ETH_MACTSCR)*, repeat all these steps to restart the timestamp operation.

System time correction

To synchronize or update the system time in one shot (coarse correction method), complete the following steps:

1. Set the offset (positive or negative) in the timestamp update registers (*System time seconds update register (ETH_MACSTSUR)* and *System time nanoseconds update register (ETH_MACSTNUR)*).
2. Set bit 3 (TSUPDT) of the *Timestamp control Register (ETH_MACTSCR)*.

The value in the timestamp update registers is added to or subtracted from the system time when the TSUPDT bit is cleared.

To synchronize or update the system time to reduce system-time jitter (fine correction method), complete the following steps:

1. With the help of the algorithm described in [Section : System time register module](#), calculate at which rate you intend to increment or decrement the system time.
2. Update the [Timestamp addend register \(ETH_MACTSAR\)](#) with the new value and set bit 5 of the [Timestamp control Register \(ETH_MACTSCR\)](#) Register.
3. Wait for the time during which you want the new value of the Addend register to be active. This can be done by enabling the Timestamp Trigger interrupt after the system time reaches the target value.
4. Program the required target time in [PPS target time seconds register \(ETH_MACPPSTTSR\)](#) and [PPS target time nanoseconds register \(ETH_MACPPSTTNR\)](#).
5. Enable the Timestamp interrupt in bit 12 of [Interrupt enable register \(ETH_MACIER\)](#).
6. Set bit 4 in Register [Timestamp control Register \(ETH_MACTSCR\)](#).
7. When this trigger generates an interrupt, read [Interrupt status register \(ETH_MACISR\)](#).
8. Reprogram [Timestamp addend register \(ETH_MACTSAR\)](#) with the old value and set bit 5 again.

64.9.11 Programming guidelines for PTP offload feature

Programming guidelines to enable automatic periodic generation of PTP sync messages

Follow these steps to enable automatic periodic generation of PTP sync messages:

1. Program SNAPTYPSEL, TSMSTRENA, and TSEVNTENA fields of [Timestamp control Register \(ETH_MACTSCR\)](#) to 0, 1, and 1 respectively, to configure the node as Ordinary or Boundary Master (1, 1, and 1 for Transparent Master).
2. Program the PTOEN bit and DN field of [PTP Offload control register \(ETH_MACPOCR\)](#) to enable PTP Offload feature and domain number to send in egress PTP Sync message.
3. Program the ASYNCEN bit of [PTP Offload control register \(ETH_MACPOCR\)](#) to enable periodic generation of PTP Sync messages.
4. Program the 80-bit Source Port Identity in [PTP Source Port Identity 0 Register \(ETH_MACSPI0R\)](#), [PTP Source port identity 1 register \(ETH_MACSPI1R\)](#) and [PTP Source port identity 2 register \(ETH_MACSPI2R\)](#) to send in egress PTP Sync message.
5. Program the LSI field of [Log message interval register \(ETH_MACLMIR\)](#) to program the periodicity of the PTP Sync messages.
For example, a value of 1 corresponds to 2^1 which translates to PTP Sync message every 2 seconds, and a value of 0xFF (two's complement of -1) corresponds to 2^{-1} which translates to PTP Sync message every 0.536 seconds.
6. Program the TSIE bit of [Interrupt enable register \(ETH_MACIER\)](#) to enable generation of Timestamp interrupt.
7. Wait for `sbd_intr_o` interrupt generated by setting TXTSSIS bit in [Timestamp status register \(ETH_MACTSSR\)](#). It indicates that the timestamp for PTP Sync message is captured in [Tx timestamp status seconds register \(ETH_MACTXTSSSR\)](#) and [Tx timestamp status nanoseconds register \(ETH_MACTXTSSNR\)](#).

Programming guidelines to enable periodic generation of PTP Pdelay_Req messages

Follow these steps to enable automatic periodic generation of PTP Pdelay_Req messages

1. Program SNAPTYPSEL, TSMSTRENA and TSEVNTENA fields of *Timestamp control Register (ETH_MACTSCR)* to 1, 0, and 1 respectively to configure the node as Transparent Slave (1, 1, and 1 for Transparent Master OR 3, X, and X for Peer-to-Peer Transparent).
2. Program the PTOEN bit and DN field of *PTP Offload control register (ETH_MACPOCR)* to enable PTP Offload feature and domain number to send in egress PTP Pdelay_Req message.
3. Program the APDREQEN bit of *PTP Offload control register (ETH_MACPOCR)* to enable periodic generation of PTP Pdelay_Req messages.
4. Program the 80-bit Source Port Identity in *PTP Source Port Identity 0 Register (ETH_MACSPI0R)*, *PTP Source port identity 1 register (ETH_MACSPI1R)* and *PTP Source port identity 2 register (ETH_MACSPI2R)* to send in egress PTP Pdelay_Req message.
5. Program the LMPDRI field of *Log message interval register (ETH_MACLMIR)* to program the periodicity of the PTP Pdelay_Req messages.
For example, a value of 1 corresponds to 2^1 which translates to PTP Pdelay_Req message every 2 seconds, and a value of 0xFF (twos complement of -1) corresponds to 2^{-1} which translates to PTP Pdelay_Req message every 0.536 seconds.
6. Program the TSIE bit of *Interrupt enable register (ETH_MACIER)* to enable generation of Timestamp interrupt.
7. Wait for sbd_intr_o interrupt generated by setting TXTSSIS bit in *Timestamp status register (ETH_MACTSSR)*. It indicates that the timestamp for PTP Sync message is captured in *Tx timestamp status seconds register (ETH_MACTXTSSSR)* and *Tx timestamp status nanoseconds register (ETH_MACTXTSSNR)*.

Programming guidelines to enable the generation of PTP response messages for Ordinary or Boundary Master mode

Follow these steps to enable the generation of PTP response messages for Ordinary or Boundary Master mode (Periodic PTP Sync messages generated and PTP Delay_Resp message generated in response to PTP Delay_Req message):

1. Program SNAPTYPSEL, TSMSTRENA and TSEVNTENA fields of *Timestamp control Register (ETH_MACTSCR)* to 0, 1, and 1 respectively.
2. Program the PTOEN bit and DN field of *PTP Offload control register (ETH_MACPOCR)* to enable PTP Offload feature and domain number to match with ingress PTP Delay_Req message and send in egress PTP Delay_Resp message.
3. Program the 80-bit Source Port Identity in *PTP Source Port Identity 0 Register (ETH_MACSPI0R)*, *PTP Source port identity 1 register (ETH_MACSPI1R)* and *PTP Source port identity 2 register (ETH_MACSPI2R)* to match with ingress PTP Delay_Req message and send in egress PTP Delay_Resp message.
4. Program the DRSYNCR and LSI fields in *Log message interval register (ETH_MACLMIR)*. The sum of both fields is updated in logMinDelayReqInterval field of PTP Delay_Resp message.

Programming guidelines to enable the generation of PTP response messages for Ordinary or Boundary Slave mode

Follow these steps to enable generation of PTP response messages for Ordinary or Boundary Slave mode (PTP Delay_Req message generated in response to PTP Sync message):

1. Program SNAPTYPSEL, TSMSTRENA and TSEVNTENA fields of *Timestamp control Register (ETH_MACTSCR)* to 0, 0, and 1 respectively.
2. Program the PTOEN bit and DN field of *PTP Offload control register (ETH_MACPOCR)* to enable PTP Offload feature and domain Number to match with ingress PTP Sync message and send in egress PTP Delay_Req message.
3. Program the 80-bit Source Port Identity in *PTP Source Port Identity 0 Register (ETH_MACSPI0R)*, *PTP Source port identity 1 register (ETH_MACSPI1R)* and *PTP Source port identity 2 register (ETH_MACSPI2R)* to match with ingress PTP Sync message and send in egress PTP Delay_Req message.
4. Program the DRSYNCR field in *Log message interval register (ETH_MACLMIR)* to indicate one PTP Delay_Req message is generated in response to how many received PTP Sync messages.

Programming guidelines to enable the generation of PTP response messages for Transparent Slave mode

Follow these steps to enable generation of PTP response messages for Transparent Slave mode (PTP Delay_Req message generated in response to PTP Sync message, PTP Pdelay_Resp message generated in response to PTP Pdelay_Req message and Periodic PTP Pdelay_Req messages generated)

1. Program SNAPTYPSEL, TSMSTRENA and TSEVNTENA fields of *Timestamp control Register (ETH_MACTSCR)* to 1, 0, and 1 respectively.
2. Program the PTOEN bit and DN field of *PTP Offload control register (ETH_MACPOCR)* to enable PTP Offload feature and domain Number to match with ingress PTP Sync or Pdelay_Req message and send in egress PTP Delay_Req or Pdelay_Resp or Pdelay_Req message.
3. Program the 80-bit Source Port Identity in *PTP Source Port Identity 0 Register (ETH_MACSPI0R)*, *PTP Source port identity 1 register (ETH_MACSPI1R)* and *PTP Source port identity 2 register (ETH_MACSPI2R)* to match with ingress PTP Sync or Pdelay_Req message and send in egress PTP Delay_Req or Pdelay_Resp or Pdelay_Req message.
4. Program the DRSYNCR and LMPDRI fields in *Log message interval register (ETH_MACLMIR)* to indicate one PTP Delay_Req message is generated in response to how many received PTP Sync messages and periodicity of the PTP Pdelay_Req messages.
5. Program the TSIE bit of *Interrupt enable register (ETH_MACIER)* to enable generation of Timestamp interrupt.
6. Wait for sbd_intr_o interrupt generated by setting TXTSSIS bit in *Timestamp status register (ETH_MACTSSR)*. It indicates that the timestamp for PTP Sync message is captured in *Tx timestamp status seconds register (ETH_MACTXTSSSR)* and *Tx timestamp status nanoseconds register (ETH_MACTXTSSNR)* for egress PTP Pdelay_Req and Pdelay_Resp messages.

Programming guidelines to enable the generation of PTP response messages for Transparent Master mode

Follow these steps to enable generation of PTP response messages for Transparent Master mode (PTP Delay_Resp message generated in response to PTP Delay_Req message, PTP Pdelay_Resp message generated in response to PTP Pdelay_Req message and Periodic PTP Pdelay_Req or Sync messages generated):

1. Program SNAPTYPSEL, TSMSTRENA and TSEVNTENA fields of *Timestamp control Register (ETH_MACTSCR)* to 1, 1, and 1 respectively.
2. Program the PTOEN bit and DN field of *PTP Offload control register (ETH_MACPOCR)* to enable PTP Offload feature and domain number to match with ingress PTP Delay_Req or Pdelay_Req message and send in egress PTP Delay_Resp or Pdelay_Resp or Pdelay_Req or Sync message.
3. Program the 80-bit Source Port Identity in *PTP Source Port Identity 0 Register (ETH_MACSPI0R)*, *PTP Source port identity 1 register (ETH_MACSPI1R)* and *PTP Source port identity 2 register (ETH_MACSPI2R)* to match with ingress PTP Delay_Req or Pdelay_Req message and send in egress PTP Delay_Resp or Pdelay_Resp or Pdelay_Req or Sync message.
4. Program the DRSYNCR, LSI and LMPDRI fields in *Log message interval register (ETH_MACLMIR)*, the sum of DRSYNCR and LSI is updated in logMinDelayReqInterval field of PTP Delay_Resp message and periodicity of the PTP Sync or Pdelay_Req messages.
5. Program the TSIE bit of *Interrupt enable register (ETH_MACIER)* to enable generation of Timestamp interrupt.
6. Wait for sbd_intr_o interrupt generated by setting TXTSSIS bit in *Timestamp status register (ETH_MACTSSR)*. It indicates that the timestamp for PTP Sync message is captured in *Tx timestamp status seconds register (ETH_MACTXTSSSR)* and *Tx timestamp status nanoseconds register (ETH_MACTXTSSNR)* for egress PTP Sync, Pdelay_Req and Pdelay_Resp messages.

Programming guidelines to enable the generation of PTP response messages for Peer-to-Peer Transparent mode

Follow these steps to enable generation of PTP response messages for Peer-to-Peer Transparent mode (PTP Pdelay_Resp message generated in response to PTP Pdelay_Req message and Periodic PTP Pdelay_Req messages generated):

1. Program the SNAPTYPSEL, TSMSTRENA and TSEVNTENA fields of *Timestamp control Register (ETH_MACTSCR)* to 3, X, and X respectively.
2. Program the PTOEN bit and DN field of *PTP Offload control register (ETH_MACPOCR)* to enable PTP Offload feature and domain Number to match with ingress PTP Pdelay_Req message and send in egress PTP Pdelay_Resp message.
3. Program the 80-bit Source Port Identity in *PTP Source Port Identity 0 Register (ETH_MACSPI0R)*, *PTP Source port identity 1 register (ETH_MACSPI1R)* and *PTP*

- Source port identity 2 register (ETH_MACSPI2R)* to match with ingress PTP Pdelay_Req message and send in egress PTP Pdelay_Resp message.
4. Program the LMPDRI field in *Log message interval register (ETH_MACLMIR)* to indicate periodicity of the PTP Pdelay_Req messages
 5. Program the TSIE bit of *Interrupt enable register (ETH_MACIER)* to enable generation of Timestamp interrupt
 6. Wait for sbd_intr_o interrupt generated by setting TXTSSIS bit in *Timestamp status register (ETH_MACTSSR)*. It indicates that the timestamp for PTP Sync message is captured in *Tx timestamp status seconds register (ETH_MACTXTSSSR)* and *Tx timestamp status nanoseconds register (ETH_MACTXTSSNR)* for egress PTP Pdelay_Req and Pdelay_Resp messages.

64.9.12 Programming guidelines for AV feature

Initializing the DMA

Complete the following steps to initialize the DMA:

1. Provide a software reset to reset all registers and logic (bit 0 in ETH_DMAMR).
2. Wait for the completion of the reset process. Poll bit 0 of the ETH_DMAMR, which is cleared only when the reset operation is completed.
3. Program the fields to initialize the DMA register by setting the values in ETH_DMAMR register.
4. Create a proper descriptor list for transmit and receive. In addition, ensure that the DMA owns the Transmit and Receive descriptors. When OSF mode is used, at least two TX descriptors are required. For more information about descriptors, refer to [Section 64.10: Descriptors](#).
5. Make sure that your software creates three or more different transmit or receive descriptors in the list before reusing any of the descriptors.
6. Program the Transmit and Receive Ring length registers (*Channel i Tx descriptor ring length register (ETH_DMACiTXRLR)* and *Channel 0 Rx descriptor ring length register (ETH_DMAC0RXRLR)*). The ring length programmed must be at least 4.
7. Initialize the receive and transmit descriptor list address with the base address of the transmit and receive descriptor (*Channel i Tx descriptor list address register (ETH_DMACiTXDLAR)*, *Channel 0 Rx descriptor list address register (ETH_DMAC0RXDLAR)*). In addition, program the Transmit and Receive tail pointer registers indicating the available descriptors to the DMA (*Channel i Tx descriptor tail pointer register (ETH_DMACiTXDTPR)* and *Channel 0 Rx descriptor tail pointer register (ETH_DMAC0RXDTPR)*).
8. Program the following fields to initialize the operating mode in the ETH_MTLTXQ0OMR:
 - a) Transmit Store And Forward (TSF)
 - b) Transmit Threshold Control (TTC)
 - c) Transmit Queue Enable (TXQEN) to value 10 to enable Transmit Queue0
 - d) Transmit Queue Size (TQS)
9. Enable the interrupts by programming the EH_DMALIER.
10. Repeat steps 4 to 9 for all the Tx DMA and RX DMA channels.

11. Program the CBS control register, idleSlope, sendSlope, hiCredit, and loCredit registers of the AV queues.
12. Start the Receive and Transmit DMA by setting bit 0 of the ETH_DMACH0TXCR and bit 0 of the ETH_DMACH0RXCR (see [Channel i transmit control register \(ETH_DMACHiTXCR\)](#) and [Channel 0 receive control register \(ETH_DMACH0RXCR\)](#)).

Enabling slot number checking

You can use the slot number check feature to specify the intervals at which the DMA Channels mapped to AV queues fetches the frames from the AHB/AXI system bus. This feature is useful to ensure a uniform and periodic transfer of the AV traffic from the host memory. It is available only when timestamping is enabled and the [Subsecond increment register \(ETH_MACSSIR\)](#) is programmed. Complete the following steps to enable the slot number checking:

Note: The slot number checking steps should be complete after programming the CBS control register, idleSlope, sendSlope, hiCredit, and loCredit registers of the AV queues (step 11 of [Section : Initializing the DMA](#)), and before starting the Receive and Transmit DMA (step 12).

1. Enable timestamping by following the steps described in [Section : Initializing the System time generation](#).
2. Make sure that the SLOTNUM field (bits 22 to 19) of TDES3 Normal Descriptor (Read Format) contains a valid slot number. To do this, read the current reference slot number from the [Channel i slot function control status register \(ETH_DMACHiSFCSR\)](#).
3. Set bit 0 (ESC) of [Channel i slot function control status register \(ETH_DMACHiSFCSR\)](#) to enable the slot number checking.

Enabling average bits per slot reporting

The CBS Status register of the additional AV channels provides information about the average bits that are transmitted in a slot. The software can asynchronously read this register to retrieve information about the average bits transmitted per slot. Complete the following steps to enable average bits per slot reporting:

1. Enable timestamping by following the steps described in [Section : Initializing the System time generation](#).
2. Program SLC bits of the [Tx queue 1 ETS control Register \(ETH_MTLTXQ1ECR\)](#) of a channel with number of slots over which the average transmitted bits per slot need to be computed.
3. Enable ABPSIE of the [Queue i interrupt control status Register \(ETH_MTLQiICSR\)](#) of a channel to generate the average bits per slot interrupt.

Note: The frequency of this interrupt depends on the value programmed during previous step. For example, when you program value 0 in the SLC field, the interrupt is generated at every 125 microsecond.

When it is not required, you can disable this interrupt to stop the interrupt flooding.

4. Read ABS bits from [Tx queue i ETS status Register \(ETH_MTLTXQiESR\)](#) of a channel on each interrupt.

The software can read the ABS bits in polling mode even if the ABPSIE bit is not enabled. When high, bit 1 (ABPSIS) of [Queue i interrupt control status Register \(ETH_MTLQiICSR\)](#) indicates that a new value is updated in the ABS field.

Disabling flow control for AV-enabled queues

Transmit flow

Program the EHFC (Enable Hardware Flow Control) bit of corresponding *Rx queue i operating mode register (ETH_MTLRXQiOMR)* to 0.

64.9.13 Programming guidelines for Energy Efficient Ethernet (EEE)

Entering and exiting Tx LPI mode

EEE enables the IEEE 802.3 Media Access Control (MAC) sublayer along with a family of physical layers to operate in the Low-power idle (LPI) mode. In the Transmit path, the software must set the LPIEN bit of the *LPI control and status register (ETH_MACLCSR)* to indicate to the MAC to stop transmission and initiate the LPI protocol.

Complete the following steps during MAC initialization:

1. Read the PHY register through the MDIO interface and check if the remote end has the EEE capability. Then negotiate the timer values.
2. Program the PHY registers through the MDIO interface (including the RX_CLK_stoppable bit that indicates to the PHY whether to stop Rx clock in LPI mode or not).
3. Program bits 25 to 16 and bits 15 to 0 in *LPI timers control register (ETH_MACLTCR)*.
4. Read the PHY link status by using the MDIO interface and update bit 17 of *LPI control and status register (ETH_MACLCSR)*.
Update *LPI control and status register (ETH_MACLCSR)* accordingly. This update should be done whenever the link status in the PHY chip changes.
5. Program *One-microsecond-tick counter register (ETH_MAC1USTCR)* as per the frequency of the clock used for accessing the CSR slave port.
6. Program the LPIET bit in the *LPI entry timer register (ETH_MACLETR)* with the IDLE time for which the MAC should wait before entering the LPI state on its own.
7. Set LPITE and LPITXA (bits 20 to 19) of *LPI control and status register (ETH_MACLCSR)* to enable LPI auto-entry and MAC auto-exit from LPI state.
8. Set bit 16 of *LPI control and status register (ETH_MACLCSR)* to put the MAC transmitter in LPI state.
The MAC enters the LPI state when all scheduled packets are completed. It remains IDLE for the time indicated by LPIET bits. It sets the TLPIEN (bit 0) after entering LPI state.
9. When a packet transmission is scheduled (when the TxDMA exits IDLE state or when a packet is presented at ATI or MTI interface), the MAC Transmitter automatically exits LPI state. It waits for TWT time before setting the TLPIEX interrupt status bit and then resume the packet transmission.
10. The MAC Transmitter enters again LPI state if it remains IDLE for LPIET time. It then sets the TLPIEN bit and the entry-exit cycle continues.
11. Reset LPIEN bit if the application needs to override the auto-entry/exit modes and directly exit the MAC Transmitter from LPI state.

Note: To make sure the MAC enters the LPI state only after the transmission of all the queued frames in the Tx FIFO is complete, set LPITXA bit in *LPI control and status register (ETH_MACLCSR)*.

To switch off the GMII Transmit clock during the LPI state, use the *sbd_tx_clk_gating_ctrl_o* signal to gate the clock input.

To switch off the CSR clock or power to the rest of the system during the LPI state, wait for the TLPIEN interrupt of *LPI control and status register (ETH_MACLCSR)* to be generated. Restore the clocks before performing step 6 when you want to come out of the LPI state.

Gating Off the CSR Clock in the LPI mode

You can gate off the CSR clock to save the power when the MAC is in the Low-Power Idle (LPI) mode.

Gating off the CSR clock in the Rx LPI mode

The following operations are performed when the MAC receives the LPI pattern from the PHY:

1. The MAC RX enters the LPI mode and the Rx LPI entry interrupt status (RLPIEN interrupt of *LPI control and status register (ETH_MACLCSR)*) is set.
2. The interrupt pin (*sbd_intr_o*) is asserted. The *sbd_intr_o* interrupt is cleared when the host reads the *LPI control and status register (ETH_MACLCSR)*.

After the *sbd_intr_o* interrupt is asserted and the MAC TX is also in the LPI mode, the CSR clock can be gated off. If the MAC TX is not in LPI mode when the CSR clock is gated off, the events on the MAC transmitter do not get reported or updated in the CSR. To restore the CSR clock, wait for the LPI exit indication from the PHY after which the MAC asserts the LPI exit interrupt on *lpi_intr_o* (synchronous to *clk_rx_i*). The *lpi_intr_o* interrupt is cleared when *LPI control and status register (ETH_MACLCSR)* is read.

Gating off the CSR clock in the Tx LPI mode

The following operations are performed when bit 16 (LPIEN) of *LPI control and status register (ETH_MACLCSR)* is set:

1. The Transmit LPI Entry interrupt (TLPIEN bit of *LPI control and status register (ETH_MACLCSR)*) is set.
2. The interrupt pin (*sbd_intr_o*) is asserted. The *sbd_intr_o* interrupt is cleared when the host reads the *LPI control and status register (ETH_MACLCSR)*.

After the *sbd_intr_o* interrupt is asserted and the MAC RX is also in the LPI mode, the CSR clock can be gated off. If the MAC RX is not in LPI mode when the CSR clock is gated off, the events on the MAC receiver do not get reported or updated in the CSR. To restore the CSR clock, switch on the CSR clock when the MAC has exited TX LPI mode. After the CSR clock is resumed, reset bit 16 (LPIEN) of *LPI control and status register (ETH_MACLCSR)* to exit the MAC from LPI mode.

64.9.14 Programming guidelines for flexible pulse-per-second (PPS) output

Generating a single pulse on PPS

To generate a single pulse on PPS:

1. Program TRGTMODSEL[1:0] bit to 11 or 10 (for interrupt) in *PPS control register (ETH_MACPPSCR)*. This instructs the MAC to use the Target Time registers (*PPS*

target time seconds register (ETH_MACPPSTTSR) and *PPS target time nanoseconds register (ETH_MACPPSTTNR)* as start time of PPS signal output.

2. Program the start time value in the Target Time registers (register *PPS target time seconds register (ETH_MACPPSTTSR)* and *PPS target time nanoseconds register (ETH_MACPPSTTNR)*).
3. Program the width of the PPS signal output in *PPS width register (ETH_MACPPSWR)* Register.
4. Program PPSCMD[3:0] of *PPS control register (ETH_MACPPSCR)* to 0001. This instructs the MAC to generate a single pulse on the PPS signal output at the time programmed in the Target Time registers.

Generating next pulse on PPS

When the PPSCMD is executed (PPSCMD bits = 0), you can cancel the pulse generation by giving the Cancel Start Command (PPSCMD=0011) before the programmed start time has elapsed. You can also program the behavior of the next pulse in advance. To program the next pulse:

1. Program the start time for the next pulse in the Target Time registers. This time should be higher than the time at which the falling edge occurs for the previous pulse.
2. Program the width of the next PPS signal output in *PPS width register (ETH_MACPPSWR)*.
3. Program PPSCMD[3:0] bits of *PPS control register (ETH_MACPPSCR)* to generate a single pulse after the previous pulse is deasserted. This instructs the MAC to generate a single pulse on the PPS signal output at the time programmed in Target Time registers.

If this command is given before the previous pulse becomes low, then the new command overwrites the previous command and the peripheral may generate only 1 extended pulse.

Generating a pulse train on PPS

To generate a pulse train on PPS:

1. Program TRGTMODSEL[1:0] bits to 11 or 10 (for interrupt) in *PPS control register (ETH_MACPPSCR)*. This instructs the MAC to use the Target Time registers (*PPS*

target time seconds register (ETH_MACPPSTTSR) and *PPS target time nanoseconds register (ETH_MACPPSTTNR)* for start time of the PPS signal output.

2. Program the start time value in the Target Time registers (register *PPS target time seconds register (ETH_MACPPSTTSR)* and *PPS target time nanoseconds register (ETH_MACPPSTTNR)*).
3. Program the interval value between the train of pulses on the PPS signal output in *PPS interval register (ETH_MACPPSIR)*.
4. Program the width of the PPS signal output in *PPS width register (ETH_MACPPSWR)*.
5. Program PPSCMD[3:0] bits in *PPS control register (ETH_MACPPSCR)* to 0010. This instructs the MAC to generate a train of pulses on the PPS signal output at the start time programmed in Target Time registers.
By default, the PPS pulse train is free-running unless it is stopped by issuing a 'STOP Pulse train at time' or 'STOP Pulse Train immediately' commands.
6. Program the stop value in the Target Time registers. Ensure that TSTRBUSY bit in *PPS target time nanoseconds register (ETH_MACPPSTTNR)* is reset before programming the Target Time registers again.
7. Program the PPSCMD[3:0] bits in *PPS control register (ETH_MACPPSCR)* to 0100 to stop the train of pulses on PPS signal output after the programmed stop time specified at step 6 has elapsed.

The pulse train can be stopped at any time by programming 0101 in the PPSCMD[3:0] field.

Similarly, the Stop Pulse train command (given in Step 7) can be canceled by programming PPSCMD[3:0] bits to 0110 before the time (programmed at step 6) has elapsed.

The pulse train generation can be stopped by programming PPSCMD[3:0] to 0011 before the start time programmed at step 2) has elapsed.

Generating an interrupt without affecting the PPS

TRGTMODSEL[1:0] bits in *PPS control register (ETH_MACPPSCR)* enable you to program the Target Time registers (*PPS target time seconds register (ETH_MACPPSTTSR)* and *PPS target time nanoseconds register (ETH_MACPPSTTNR)*) to do any one of the following:

- Generate only interrupts.
- Generate interrupts and the PPS start and stop time.
- Generate only PPS start and stop time.

To program the Target Time registers to generate only interrupt event:

1. Program TRGTMODSEL[1:0] bits of *PPS control register (ETH_MACPPSCR)* to 00 (for interrupt). This instructs the MAC to use the Target Time registers for target time interrupt.
2. Program a target time value in the Target Time registers. This instructs the MAC to generate an interrupt when the target time elapses.

If TRGTMODSEL[1:0] bits are changed (for example, to control the PPS), then the interrupt generation is overwritten with the new mode and new programmed Target Time register value.

Note: *The TSTRGTERR0 bit in *Timestamp status register (ETH_MACTSSR)* is set when the programmed target time is smaller (that is corresponds to a time in the past) compared to*

the system time in the *System time seconds register (ETH_MACSTSR)* and *System time nanoseconds register (ETH_MACSTNR)*.

An interrupt is generated (*sbd_intr_o*) if the *TSIE* bit in the *Interrupt enable register (ETH_MACIER)* is set.

Therefore, to avoid unwanted interrupt, the correct writing order is as follow:

1. *PPS target time nanoseconds register (ETH_MACPPSTTNR)*.
2. *PPS target time seconds register (ETH_MACPPSTTSR)*.
3. *PPS interval register (ETH_MACPPSIR)*.
4. *PPS width register (ETH_MACPPSWR)*.
5. *PPSCTRL[3:0]* and *PPSCTRL[3:0]* and *PPSEN0* bitfields of *PPS control register (ETH_MACPPSCR)*.

64.9.15 Programming guidelines for TSO

The TCP Segmentation Offload (TSO) engine is used to offload the TCP segmentation functions to the hardware. To program the TSO, set the *TSE* bit to enable TCP packet segmentation, and program descriptor fields to enable TSO for the current packet.

Follow the steps below to program TSO:

1. Program *TSE* bit of the corresponding *Channel i transmit control register (ETH_DMACiTXCR)* to enable TCP packet segmentation in that DMA.
2. In addition to the normal transfer descriptor setting, the following descriptor fields must be programmed to enable TSO for the current packet:
 - a) Enable *TSE* of *TDES3* (bit 18).
 - b) Program the length of the unsegmented TCP/IP packet payload in bits 17 to 0 of *TDES3*, and the TCP header in bits 22 to 19 of *TDES3*.
 - c) Program the maximum size of the segment in:
 - *MSS[13:0]* of *Channel i control register (ETH_DMACiCR)*
 - or *MSS* in the context descriptor
 If *MSS[13:0]* field is programmed in both *Channel i control register (ETH_DMACiCR)* and in the context descriptor, the latest software programmed sequence is considered.
3. The unsegmented TCP/IP packet header should be stored in Buffer 1 of the first descriptor. This buffer must not hold any payload bytes. The payload is allocated to Buffer 2 and the buffers of the subsequent descriptors.

Caution: If *TSE* is enabled in *TDES3* for a non-TCP-IP packet, the result is unpredictable.

64.9.16 Programming guidelines to perform VLAN filtering on the receive

Follow the sequence below to perform VLAN filtering on the receiver:

1. Program *VLAN tag register (ETH_MACVTR)* for the following bit to select the filtering method:
 - ETV: Enable 12-bit VLAN Tag Comparison or 16-bit VLAN Tag comparison.
 - VTHM: VLAN Tag Hash Table Match Enable.
 - ERIVLT: Enable inner VLAN Tag or outer VLAN Tag (to enable the inner or outer VLAN Tag filtering, Double VLAN Processing should be enabled by setting EDVLP)
 - ERSVLM: Enable Receive S-VLAN Match or C-VLAN match (for S-VLAN processing to be enabled, set ESVL)
 - DOVLTC: Ignores VLAN Type for Tag Match
 - VTIM: to enable VLAN Tag Inverse Match instead of the normal VLAN Tag matching
2. Program VL bit in *VLAN tag register (ETH_MACVTR)* for the 12-bit or 16-bit VLAN tag.
3. If VLAN tag Hash filtering is enabled, program *VLAN Hash table register (ETH_MACVHTR)*.
 - When the ETV bit is reset, the upper 4 bits of the calculated CRC-32 of VLAN tag are inverted and used to index the content of the *VLAN Hash table register (ETH_MACVHTR)*.
 - When ETV bit is set, the upper 4 bits of the calculated CRC-32 of VLAN tag are used to index the content of *VLAN Hash table register (ETH_MACVHTR)*.

For example, when ETV bit is set, a hash value of 0b1000 selects bit 8 of the VLAN Hash table. When ETV bit is reset, a hash value of 0b1000 selects bit 7 of the VLAN Hash table.

64.10

Descriptors

64.10.1 Descriptor overview

In the Ethernet peripheral, the DMA transfers data based on a linked list of descriptors. The application creates the descriptors in the system memory (SRAM). The following two types of descriptors are supported:

- **Normal descriptors**

The normal descriptors are used for packet data and to provide control information applicable to the packets to be transmitted.
- **Context descriptors**

The context descriptors are used to provide control information applicable to the packet to be transmitted.

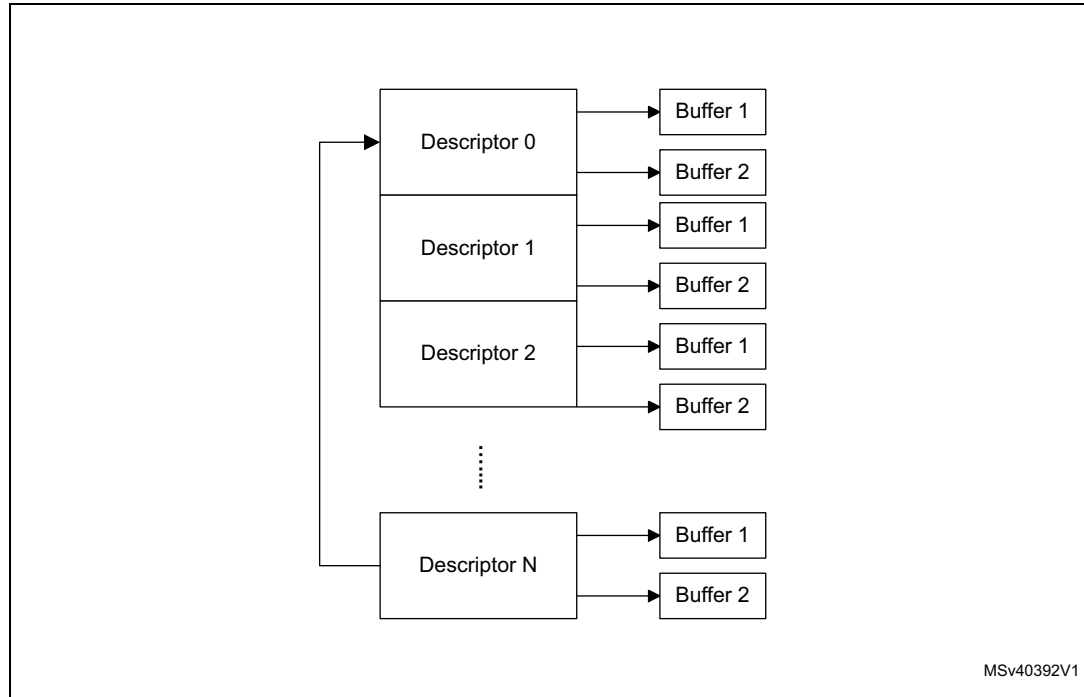

Each normal descriptor contains two buffers and two address pointers. These buffers enable the adapter port to be compatible with various types of memory management schemes.

There is no limit to the number of descriptors that can be used for a single packet.

64.10.2 Descriptor structure

The Ethernet peripheral supports the ring structure for DMA descriptors.

Figure 809. Descriptor ring structure

In a ring structure, descriptors are separated by the 64-bit word number programmed in the DSL field of the *Channel i control register (ETH_DMACiCR)*. The application needs to program the total ring length, that is the total number of descriptors in ring span, in the following registers of a DMA channel:

- *Channel i Tx descriptor ring length register (ETH_DMACiTXRLR)*
- *Channel 0 Rx descriptor ring length register (ETH_DMAC0RXRLR)*

The *Channel i Tx descriptor tail pointer register (ETH_DMACiTXDTPR)* or *Channel 0 Rx descriptor tail pointer register (ETH_DMAC0RXDTPR)* contains the pointer to the descriptor address (N). The base address and the current descriptor pointer decide the address of the current descriptor that the DMA can process. The descriptors up to one location less than the one indicated by the descriptor tail pointer ($N - 1$) are owned by the DMA. The DMA continues to process the descriptors until the following condition occurs:

Current Descriptor Pointer == Descriptor Tail Pointer;

The DMA enters the Suspend state when this condition occurs. The application must perform a write operation to the Descriptor tail pointer register and update the tail pointer so that the following condition is met:

Current Descriptor Pointer < Descriptor Tail Pointer;

The DMA automatically wraps around the base address when the end of ring is reached, as shown in [Figure 810: DMA descriptor ring](#).

Figure 810. DMA descriptor ring

For descriptors owned by the application, the OWN bit of DES3 is reset to 0.

For descriptors owned by the DMA, the OWN bit is set to 1.

At the beginning, if the application has only one descriptor, it sets the last descriptor address (tail pointer) to Descriptor Base Address + 1. The DMA then processes the first descriptor and waits for the application to increment the tail pointer.

64.10.3 Transmit descriptor

The Ethernet peripheral DMA requires at least one descriptor for a transmit packet. In addition to two buffers, two byte-count buffers, and two address pointers, the transmit descriptor features control fields which can be used to manage the MAC operation on per-transmit packet basis. The Transmit normal descriptor has the following two formats: Read format and Write-back format

Transmit normal descriptor (read format)

Figure 811 shows the Read format for Transmit normal descriptor. Table 529 to Table 532 provide a detailed description of all Transmit normal descriptors (read format).

Figure 811. Transmit descriptor (read format)

MSv40394V1

- TDES0 normal descriptor (read format)

Table 529. TDES0 normal descriptor (read format)

Bit	Name	Description
31:0	BUF1AP	Buffer 1 Address Pointer or TSO Header Address Pointer These bits indicate either the physical address of Buffer 1 or the TSO Header Address pointer when the following bits are set: – TSE bit of TDES3 – FD bit of TDES3

- TDES1 normal descriptor (read format)

Table 530. TDES1 normal descriptor (read format)

Bit	Name	Description
31:0	BUF2AP	Buffer 2 or Buffer 1 Address Pointer: These bits indicate the physical address of Buffer 2 when a descriptor ring structure is used. There is no limitation to the buffer address alignment.

- TDES2 normal descriptor (read format)

Table 531. TDES2 normal descriptor (read format)

Bits	Name	Description
31	IOC	Interrupt on completion: This bit sets the TI bit in the <i>Channel i status register (ETH_DMACiSR)</i> when the present packet transmission is complete.
30	TTSE	Transmit Timestamp Enable This bit enables the IEEE1588 timestamping for Transmit packet referenced by the descriptor.
29:16	B2L	Buffer 2 Length The driver sets this field. When set, this field indicates Buffer 2 length.
15:14	VTIR	VLAN Tag Insertion or Replacement: These bits request the MAC to perform VLAN tagging or untagging before transmitting the packets. The application must set the CRC Pad Control bits appropriately when VLAN tag insertion, replacement, or deletion is enabled for the packet. The values of these bits are as follows: 00: Do not add a VLAN tag. 01: Remove the VLAN tag from the packets before transmission. This option should be used only with the VLAN packets. 10: Insert a VLAN tag with the tag value programmed in the <i>VLAN inclusion register (ETH_MACVIR)</i> or context descriptor. 11: Replace the VLAN tag in packets with the tag value programmed in the <i>VLAN inclusion register (ETH_MACVIR)</i> or context descriptor. This option should be used only with the VLAN packets.

Table 531. TDES2 normal descriptor (read format) (continued)

Bits	Name	Description
13:0	HL or B1L	<p>Header length or buffer 1 length For Header length, only bits [9:0] are taken into account. Bits 13 to 0 are applicable only to buffer 1 length. If the TCP Segmentation Offload feature is enabled through the TSE bit of TDES3, this field is equal to the header length. When the TSE bit is set in TDES3, the header length includes the length (expressed in bytes) from Ethernet Source address till the end of the TCP header. The maximum header length supported for TSO feature is 1023 bytes. If the TCP Segmentation Offload feature is not enabled, this field is equal to Buffer 1 length.</p>

- TDES3 normal descriptor (read format)

Table 532. TDES3 normal descriptor (read format)

Bits	Name	Description
31	OWN	<p>Own bit 1: the DMA owns the descriptor. 0: the application owns the descriptor. The DMA clears this bit after it completes the transfer of data given in the associated buffer(s).</p>
30	CTXT	<p>Context Type This bit should be set to 0 for normal descriptor.</p>
29	FD	<p>First Descriptor When this bit is set, it indicates that the buffer contains the first segment of a packet.</p>
28	LD	<p>Last Descriptor When this bit is set, it indicates that the buffer contains the last segment of the packet. B1L or B2L field should have a non-zero value.</p>

Table 532. TDES3 normal descriptor (read format) (continued)

Bits	Name	Description
27:26	CPC	<p>CRC Pad Control</p> <p>This field controls the CRC and Pad Insertion for Tx packet. It is valid only when the first descriptor bit (TDES3[29]) is set. The values of bits[27:26] are the following:</p> <p>00: CRC and Pad Insertion The MAC appends the cyclic redundancy check (CRC) at the end of the transmitted packets whose length greater than or equal to 60 bytes. The MAC automatically appends padding and CRC to a packet with length less than 60 bytes.</p> <p>01: CRC Insertion (Disable Pad Insertion) The MAC appends the CRC at the end of the transmitted packet but it does not append padding. The application should ensure that the padding bytes are present in the packet being transferred from the Transmit buffer, that is, the packet being transferred from the Transmit Buffer is of length greater than or equal to 60 bytes.</p> <p>10: Disable CRC Insertion The MAC does not append the CRC at the end of the transmitted packet. The application should ensure that the padding and CRC bytes are present in the packet being transferred from the Transmit Buffer.</p> <p>11: CRC Replacement The MAC replaces the last four bytes of the transmitted packet with recalculated CRC bytes. The application should ensure that the padding and CRC bytes are present in the packet being transferred from the Transmit Buffer.</p> <p>When the TSE bit is set, the MAC ignores this field because the CRC and pad insertion is always done for segmentation.</p>
25:23	SAIC	<p>SA Insertion Control</p> <p>These bits request the MAC to add or replace the Source Address field in the Ethernet packet with the value given in the MAC Address 0 register. The application must appropriately set the CRC Pad Control bits when SA Insertion Control is enabled for the packet.</p> <p>Bit 25 specifies the MAC Address Register (1 or 0) value that is used for Source Address insertion or replacement.</p> <p>The following list describes the values of Bits[24:23]:</p> <p>00: Do not include the source address</p> <p>01: Include or insert the source address. For reliable transmission, the application must provide frames without source addresses.</p> <p>10: Replace the source address. For reliable transmission, the application must provide frames with source addresses.</p> <p>11: Reserved</p> <p>These bits are valid when the First Segment control bit (TDES3 [29]) is set.</p>

Table 532. TDES3 normal descriptor (read format) (continued)

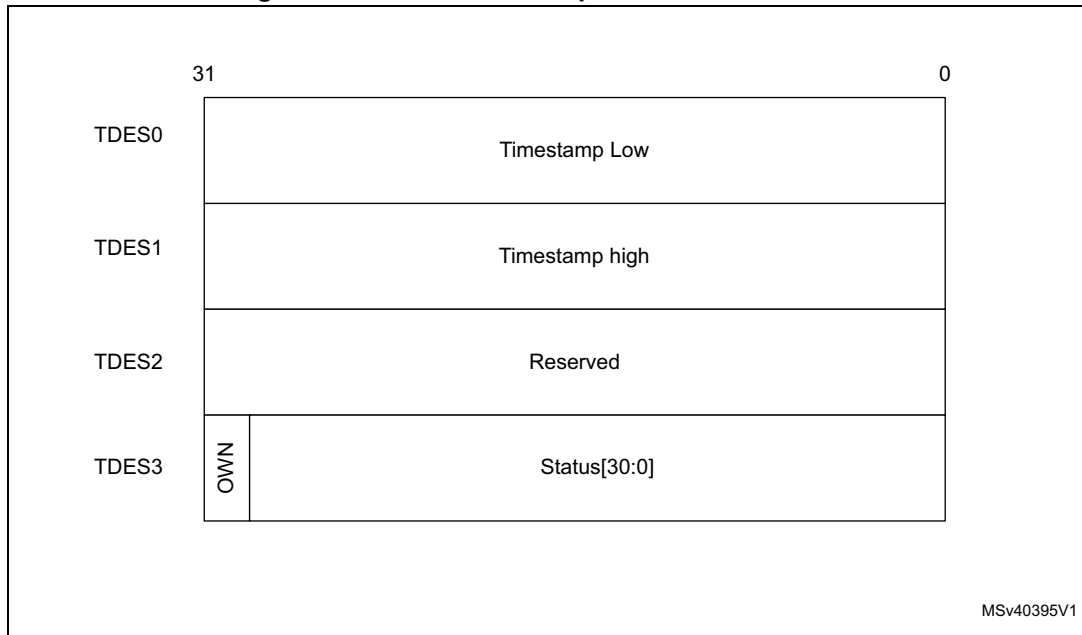

Bits	Name	Description
22:19	SLOTNUM or THL	<p>SLOTNUM: Slot Number Control Bits in AV mode These bits indicate the slot interval in which the data should be fetched from the corresponding buffers addressed by TDES0 or TDES1. When the Transmit descriptor is fetched, the DMA compares the slot number value in this field with the slot interval maintained in the RSN field of <i>Channel i slot function control status register (ETH_DMACiSFCSR)</i>. It fetches the data from the buffers only if a value matches. These bits are valid only for the AV channels.</p> <p>THL: TCP Header Length If the TSE bit is set, this field contains the length of the TCP/UDP header. The minimum value of this field must be 5 for TCP header. THL value must be equal to 2 for UDP header. This field is valid only for the first descriptor</p>
18	TSE	<p>TCP Segmentation Enable When this bit is set, the DMA performs the TCP/UDP segmentation for a packet. This bit is valid only if the FD bit is set.</p>
17:16	CIC/TPL	<p>Checksum Insertion Control or TCP Payload Length These bits control the checksum calculation and insertion. They can take the following values: 00: Checksum insertion disabled. 01: Only IP header checksum calculation and insertion are enabled. 10: IP header checksum and payload checksum calculation and insertion are enabled, but pseudo-header checksum is not calculated in hardware. 11: IP header checksum and payload checksum calculation and insertion are enabled, and pseudo-header checksum is calculated in hardware. This field is valid when the TSE bit is reset. When the TSE bit is set, it contains the upper bits [17:16] of the TCP Payload length. This allows the TCP packet length field to be spanned across TDES3[17:0] to provide 256 Kbyte packet length support.</p>
15	TPL	<p>Reserved or TCP Payload Length When the TSE bit is reset, this bit is reserved. When the TSE bit is set, this is bit 15 of the TCP payload length [17:0].</p>
14:0	FL/TPL	<p>Reserved or TCP Payload Length When the TSE bit is set, this field is equal to the lower 15 bits of the TCP payload length. This length does not include Ethernet header or TCP/UDP/IP header length. When the TSE bit is reset, this bit is reserved.</p>

Transmit normal descriptor (write-back format)

The write-back format is applicable only for the last descriptor of the corresponding packet. The LD bit (TDES3[28]) is set in the descriptor where the DMA writes back the status and timestamp information for the corresponding Transmit packet.

Figure 812 shows the write-back format for Transmit normal descriptors. *Table 533* to *Table 536* provide a detailed description of all Transmit Normal descriptors (Write-Back Format).

Figure 812. Transmit descriptor write-back format

MSv40395V1

- TDES0 normal descriptor (write-back format)

Table 533. TDES0 normal descriptor (write-back format)⁽¹⁾

Bit	Name	Description
31:0	TTSL	Transmit Packet Timestamp Low The DMA updates this field with least significant 32 bits of the timestamp captured for the corresponding Transmit packet. The DMA writes the timestamp only if TTSE bit of TDES2 is set in the first descriptor of the packet. This field holds the timestamp only if the Last Segment bit (LS) in the descriptor is set and the Timestamp status (TTSS) bit is set.

1. This format is only applicable to the last descriptor of a packet.

- TDES1 normal descriptor (write-back format)

Table 534. TDES1 normal descriptor (write-back format)⁽¹⁾

Bit	Name	Description
31:0	TTSH	Transmit Packet Timestamp High The DMA updates this field with the most significant 32 bits of the timestamp captured for corresponding Receive packet. The DMA writes the timestamp only if the TTSE bit of TDES2 is set in the first descriptor of the packet. This field has the timestamp only if the Last Segment bit (LS) in the descriptor is set and Timestamp status (TTSS) bit is set.

1. This format is only applicable to the last descriptor of a packet.

- TDES2 normal descriptor (write-back format)

Table 535. TDES2 normal descriptor (write-back format)⁽¹⁾

Bit	Description
31:0	Reserved

1. This format is only applicable to the last descriptor of a packet.

- TDES3 normal descriptor (write-back format)

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

ES	JT	FF	PCE	LoC	NC	LC	EC	CC				ED	UF	DB	IHE

Table 536. TDES3 normal descriptor (write-back format)⁽¹⁾

Bit	Name	Description
31	OWN	Own bit When this bit is set, it indicates that the DMA owns the descriptor. The DMA clears this bit when it completes the packet transmission. After the write-back is complete, this bit is set to 0.
30	CTXT	Context Type This bit should be set to 0 for normal descriptors.
29	FD	First Descriptor This bit indicates that the buffer contains the first segment of a packet.
28	LD	Last Descriptor This bit is set 1 for last descriptor of a packet. The DMA writes the status fields only in the last descriptor of the packet.
27:18	Reserved	
17	TTSS	Tx Timestamp Status This status bit indicates that a timestamp has been captured for the corresponding transmit packet. When this bit is set, TDES0 and TDES1 have timestamp values that were captured for the Transmit packet. This field is valid only when the Last Segment control bit (TDES3 [28]) in a descriptor is set.
16	Reserved	

Table 536. TDES3 normal descriptor (write-back format)⁽¹⁾ (continued)

Bit	Name	Description
15	ES	<p>Error Summary</p> <p>This bit indicates the logical OR of the following bits:</p> <ul style="list-style-type: none"> TDES3[0]: IP Header Error TDES3[14]: Jabber Timeout TDES3[13]: Packet Flush TDES3[12]: Payload Checksum Error TDES3[11]: Loss of Carrier TDES3[10]: No Carrier TDES3[9]: Late Collision TDES3[8]: Excessive Collision TDES3[3]: Excessive Deferral TDES3[2]: Underflow Error
14	JT	<p>Jabber Timeout</p> <p>This bit indicates that the MAC transmitter has experienced a jabber timeout. This bit is set only when the JD bit of the <i>Operating mode configuration register (ETH_MACCCR)</i> is not set.</p>
13	FF	<p>Packet Flushed</p> <p>This bit indicates that the DMA or MTL flushed the packet because of a software flush command given by the CPU.</p>
12	PCE	<p>Payload Checksum Error</p> <p>This bit indicates that the Checksum Offload engine had a failure and did not insert any checksum into the encapsulated TCP, UDP, or ICMP payload. This failure can be either caused by insufficient bytes, as indicated by the Payload Length field of the IP Header, or by the MTL starting to forward the packet to the MAC transmitter in Store-and-Forward mode without the checksum having been calculated yet. This second error condition only occurs when the Transmit FIFO depth is less than the length of the Ethernet packet being transmitted to avoid deadlock, the MTL starts forwarding the packet when the FIFO is full, even in the store-and-forward mode. This error can also occur when a Bus error is detected during packet transfer.</p>
11	LoC	<p>Loss of Carrier</p> <p>This bit indicates that Loss of Carrier occurred during packet transmission (that is, the ETH_CRS signal was inactive for one or more transmit clock periods during packet transmission). This is valid only for the packets transmitted without collision and when the MAC operates in the Half-duplex mode.</p>
10	NC	<p>No Carrier</p> <p>This bit indicates that the carrier sense signal from the PHY was not asserted during transmission.</p>
9	LC	<p>Late Collision</p> <p>This bit indicates that packet transmission was aborted because a collision occurred after the collision window (64 byte times including Preamble in MII mode and 512 byte times including Preamble and Carrier Extension in GMII mode). This bit is not valid if Underflow Error is set.</p>

Table 536. TDES3 normal descriptor (write-back format)⁽¹⁾ (continued)

Bit	Name	Description
8	EC	Excessive Collision This bit indicates that the transmission was aborted after 16 successive collisions while attempting to transmit the current packet. If the DR bit is set in the <i>Operating mode configuration register (ETH_MACCCR)</i> , this bit is set after first collision and the transmission of the packet is aborted.
7:4	CC	Collision Count This 4-bit counter value indicates the number of collisions occurred before the packet was transmitted. The count is not valid when the EC bit is set.
3	ED	Excessive Deferral This bit indicates that the transmission ended because of excessive deferral of over 24,288 bit times (155,680 bits times in 1000-Mbps mode or Jumbo Packet enabled mode) if DC bit is set in the <i>Operating mode configuration register (ETH_MACCCR)</i> .
2	UF	Underflow Error This bit indicates that the MAC aborted the packet because the data arrived late from the system memory. The underflow error can occur because of either of the following conditions: The DMA encountered an empty Transmit Buffer while transmitting the packet The application filled the MTL Tx FIFO slower than the MAC transmit rate The transmission process enters the Suspend state and sets the underflow bit corresponding to a queue in the ETH_MTLISR register.
1	DB	Deferred Bit This bit indicates that the MAC deferred before transmitting because of presence of carrier. This bit is valid only in the Half-duplex mode.
0	IHE	IP Header Error When IP Header Error is set, this bit indicates that the Checksum Offload engine detected an IP header error. If COE detects an IP header error, it still inserts an IPv4 header checksum if the Ethernet Type field indicates an IPv4 payload.

1. This format is only applicable to the last descriptor of a packet.

Transmit context descriptor

The Transmit context descriptor can be provided any time before a packet descriptor. The context is valid for the current packet and subsequent packets. The context descriptor is used to provide the timestamps for one-step timestamp correction, and VLAN Tag ID for VLAN insertion feature. Write-back is only done on a context descriptor to reset the OWN bit.

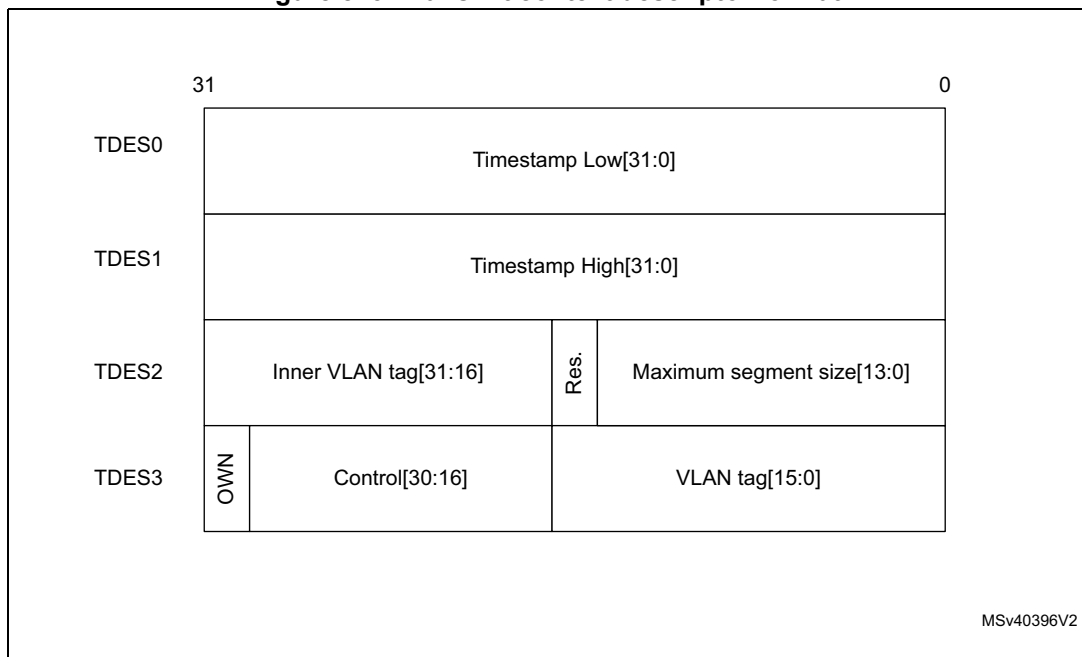

Note: The VLAN tag IDs and MSS values, which are provided by the application in a context descriptor with their corresponding Valid bits set, are stored internally by the DMA.

When the outer or inner VLAN tag is provided with the Valid bit set, the DMA always passes the last valid VLAN tag to the MTL. The application cannot invalidate the valid VLAN tag stored by the DMA. The VLAN tag is inserted or replaced based on the control inputs provided for the packet.

The Inner VLAN Tag Control input is used only for the packet that immediately follows the context descriptor. The application must provide a context descriptor before the normal descriptor of each packet for which the DMA should use the inner VLAN Tag control input.

Figure 813 shows the format for Transmit context descriptors. Table 537 to Table 540 provide a detailed description of all Transmit context descriptors.

Figure 813. Transmit context descriptor format

- TDES0 context descriptor (read format)

Table 537. TDES0 context descriptor

Bit	Name	Description
31:0	TTSL	Transmit Packet Timestamp Low For one-step correction, the driver can provide the lower 32 bits of timestamp in this descriptor word. The DMA uses this value as the low word for doing one-step timestamp correction. This field is valid only if the OSTC and TCMSSV bits of TDES3 context descriptor are set.

- TDES1 context descriptor (read format)

Table 538. TDES1 context descriptor

Bit	Name	Description
31:0	TTSH	Transmit Packet Timestamp High For one-step correction, the driver can provide the upper 32 bits of timestamp in this descriptor. The DMA uses this value as the high word for doing one-step timestamp correction. This field is valid only if the OSTC and TCMSSV bits of TDES3 context descriptor are set.

- TDES2 context descriptor (read format)

Table 539. TDES2 context descriptor

Bit	Name	Description
31:16	IVT	Inner VLAN Tag When the IVLTV bit of TDES3 context descriptor is set and the TCMSSV and OSTC bits of TDES3 context descriptor are reset, TDES2[31:16] contains the inner VLAN Tag to be inserted in the subsequent Transmit packets.
15:14	Reserved	
13:0	MSS	Maximum Segment Size This segment size is used while segmenting the TCP/IP payload. This field is valid only if the TCMSSV bit of TDES3 context descriptor is set and the OSTC bit of the TDES3 context descriptor is reset.

- TDES3 context descriptor (read format)

Table 540. TDES3 context descriptor

Bit	Name	Description
31	OWN	Own bit 1: the DMA owns the descriptor. 0: the application owns the descriptor. The DMA clears this bit immediately after a read operation.
30	CTXT	Context Type This bit should be set to 1 for context descriptor.
29:28	Reserved	
27	OSTC	One-Step Timestamp Correction Enable When this bit is set, the DMA performs a one-step timestamp correction with reference to the timestamp values provided in TDES0 and TDES1.

Table 540. TDES3 context descriptor (continued)

Bit	Name	Description
26	TCMSSV	<p>One-Step Timestamp Correction Input or MSS Valid</p> <p>When this bit and the OSTC bit are set, it indicates that the Timestamp Correction input provided in TDES0 and TDES1 is valid.</p> <p>When the OSTC bit is reset and this bit and the TSE bit of TDES3 are set in subsequent normal descriptor, it indicates that the MSS input in TDES2 is valid.</p>
25:24		Reserved
23	CDE	<p>Context Descriptor Error</p> <p>When this bit is set, it indicates that the context descriptor is incorrect. The DMA sets this bit during write-back while closing the context descriptor.</p> <p>The Context Descriptor errors can be:</p> <ul style="list-style-type: none"> – Incorrect sequence from the context descriptor. For example, a location before the first descriptor for a packet. – All 1s. – CD, LD, and FD bits set to 1. <p><i>Note: When a Context Descriptor error occurs due to All 1s or CTXT, LD, and FD bits set to 1, the Transmit DMA closes the transmit descriptor with DE and LD bits set to 1. When IOC bit in TDES2 of corresponding first descriptor is set to 1, Transmit DMA sets the TI bit in the Channel i status register (ETH_DMACiSR).</i></p> <p><i>Based on CTXT, LD, and FD bits of the transmit descriptor, the subsequent descriptor might be considered as the First Descriptor (even if FD bit is not set) and partial packet is sent.</i></p> <p><i>This error is categorized as an abnormal event; recovery is only by issuing a software reset (DMA stopping-reconfiguring-restarting recovery mechanism is not supported)</i></p>
22:20		Reserved
19:18	IVTIR	<p>Inner VLAN Tag Insert or Replace</p> <p>When these bits are set, they request the MAC to perform Inner VLAN tagging or untagging before transmitting the packets. If the packet is modified for VLAN tags, the MAC automatically recalculates and replaces the CRC bytes.</p> <p>This bitfield has the following values:</p> <p>00: Do not add the inner VLAN tag.</p> <p>01: Remove the inner VLAN tag from the packets before transmission. This option should be used only with the VLAN frames.</p> <p>10: Insert an inner VLAN tag with the tag value programmed in the Inner VLAN inclusion register (ETH_MACIVIR) or context descriptor.</p> <p>11: Replace the inner VLAN tag in packets with the tag value programmed in the Inner VLAN inclusion register (ETH_MACIVIR) or context descriptor. This option should be used only with the VLAN frames.</p>
17	IVLTV	<p>Inner VLAN Tag Valid</p> <p>When this bit is set, it indicates that the IVT field of TDES2 is valid.</p>

Table 540. TDES3 context descriptor (continued)

Bit	Name	Description
16	VLTV	VLAN Tag Valid When this bit is set, it indicates that the VT field of TDES3 is valid.
15:0	VT	VLAN Tag This field contains the VLAN Tag to be inserted or replaced in the packet. This field is used as VLAN Tag only when the VLTI bit of the VLAN inclusion register (ETH_MACVIR) is reset.

64.10.4 Receive descriptor

The DMA in the Ethernet peripheral attempts to read a descriptor only if the Tail pointer is different from the Base pointer or current pointer. It is recommended to have a descriptor ring with a length that can accommodate at least two complete packets received by the MAC; otherwise, the performance of the DMA is greatly impacted because of the unavailability of the descriptors. In such a situation, the MTL RxFIFO becomes full and starts dropping packets.

The following Receive descriptors are present:

- Normal descriptors with read and write-back formats
- Context descriptors

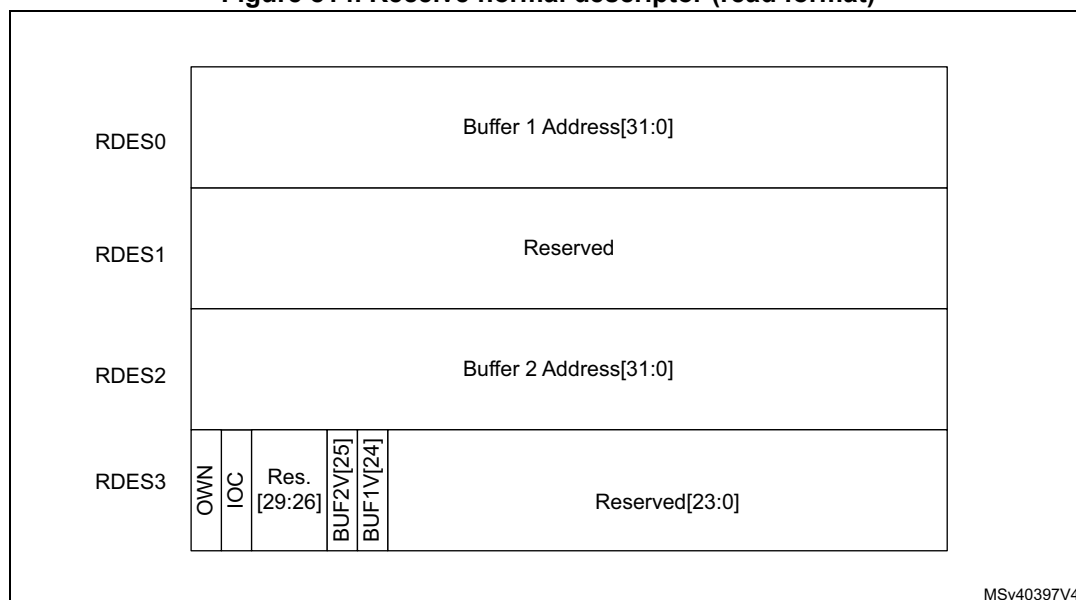

All received descriptors are prepared by the software and given to the DMA as “normal” descriptors (see [Figure 814: Receive normal descriptor \(read format\)](#) for a description of their content). The DMA reads this descriptor and, after transferring a received packet (or part of it) to the buffers indicated by the descriptor, the Rx DMA closes the descriptor with the corresponding packet status. The status format is given in [Figure 815: Receive normal descriptor \(write-back format\)](#).

For some packets, the normal descriptor bits are not sufficient to write the complete status. For such packets, the Rx DMA writes the extended status to the next descriptor (without processing or using the Buffers pointers embedded in that descriptor). The format and content of this write-back descriptor is described in [Figure 816: Receive context descriptor](#).

Receive normal descriptor (read format)

[Figure 814](#) shows the read format for Receive normal descriptors. [Table 541](#) to [Table 544](#) provide a detailed description of all Receive normal descriptors (read format).

Figure 814. Receive normal descriptor (read format)

Note: In the Receive descriptor (read format), if the Buffer Address field contains only 0s, the MAC does not transfer data to this buffer and skips to the next buffer or next descriptor.

- RDES0 normal descriptor (read format)

Table 541. RDES0 normal descriptor (read format)

Bit	Name	Description
31:0	BUF1AP	<p>Buffer 1 Address Pointer</p> <p>These bits indicate the physical address of Buffer 1. The application can program a byte-aligned address for this buffer, which means that the LS bits of this field can be non-zero. However, while transferring the start of packet, the DMA performs a write operation with RDES2[2:0]=0 in case of 64-/128-bit configuration) as zero. However, the packet data is shifted by the actual offset as given in the buffer address pointer. If the address pointer points to a buffer where the middle or last part of the packet is stored, the DMA ignores the offset address and writes to the full location as indicated by the data-width.</p>

- RDES1 normal descriptor (read format)

Table 542. RDES1 normal descriptor (read format)

Bit	Name	Description
31:0	Reserved	Field reserved.

- RDES2 normal descriptor (read format)

Table 543. RDES2 normal descriptor (read format)

Bit	Name	Description
31:0	BUF2AP	<p>Buffer 2 Address Pointer</p> <p>These bits indicate Buffer 2 physical address. The RxDMA uses the LS bits of the pointer address only while transferring the start bytes of a packet. If the BUF2AP is giving the address of a buffer in which the middle or last part of a packet is stored, the DMA ignores RDES2[2:0]=0 and writes to the complete location.</p>

Table 544. RDES3 normal descriptor (read format)

Bit	Name	Description
31	OWN	<p>Own bit</p> <p>When this bit is set, it indicates that the DMA owns the descriptor. When this bit is reset, it indicates that the application owns the descriptor. The DMA clears this bit when either of the following conditions is true:</p> <ul style="list-style-type: none"> – The DMA completes the packet reception – The buffers associated with the descriptor are full
30	IOC	<p>Interrupt Enabled on Completion</p> <p>When this bit is set, an interrupt is issued to the application when the DMA closes this descriptor.</p>
29:26	Reserved	
25	BUF2V	<p>Buffer 2 Address Valid</p> <p>When this bit is set, it indicates to the DMA that the buffer 2 address specified in RDES2 is valid. The application must set this bit so that the DMA can use the address to which the Buffer 2 address in RDES0 is pointing, to write received packet data.</p>
24	BUF1V	<p>Buffer 1 Address Valid</p> <p>When set, this indicates to the DMA that the buffer 1 address specified in RDES0 is valid.</p> <p>The application must set this value if the address to which Buffer 1 address points in RDES0, can be used by the DMA to write received packet data.</p>
23:0	Reserved	

Receive normal descriptor (write-back format)

Figure 815 shows the write-back format for Receive normal descriptors. Table 545 to Table 548 provide a detailed description of all Receive normal descriptors (write-back format).

Figure 815. Receive normal descriptor (write-back format)

- RDES0 normal descriptor (write-back format)

Table 545. RDES0 normal descriptor (write-back format)

Bit	Name	Description
31:16	IVT	Inner VLAN Tag This field contains the Inner VLAN tag of the received packet if the RS0V bit of RDES3 is set. This is valid only when Double VLAN tag processing and VLAN tag stripping are enabled.
15:0	OVT	Outer VLAN Tag This field contains the Outer VLAN tag of the received packet if the RS0V bit of RDES3 is set.

- RDES1 normal descriptor (write-back format)

Table 546. RDES1 normal descriptor (write-back format)⁽¹⁾

Bit	Name	Description
31:16	OPC	<p>OAM Subtype Code, or MAC Control Packet opcode</p> <p>OAM Subtype Code If bits[18:16] of RDES3 are set to 111, this field contains the OAM subtype and code fields.</p> <p>MAC Control Packet opcode If bits[18:16] of RDES3 are set to 110, this field contains the MAC Control packet opcode field.</p>
15	TD	<p>Timestamp Dropped</p> <p>This bit indicates that the timestamp was captured for this packet but got dropped in the MTL Rx FIFO because of overflow.</p>
14	TSA	<p>Timestamp Available</p> <p>When Timestamp is present, this bit indicates that the timestamp value is available in a context descriptor word 2 (RDES2) and word 1(RDES1). This is valid only when the Last Descriptor bit (RDES3 [28]) is set.</p> <p>The context descriptor is written in the next descriptor just after the last normal descriptor for a packet.</p>
13	PV	<p>PTP Version</p> <p>1: Received PTP message in IEEE 1588 version 2 format 0: Received PTP message in IEEE 1588 version 1 format</p>
12	PFT	<p>PTP Packet Type</p> <p>This bit indicates that the PTP message is sent directly over Ethernet.</p>
11:8	PMT	<p>PTP Message Type</p> <p>These bits are encoded to give the type of the message received:</p> <ul style="list-style-type: none"> 0000: No PTP message received 0001: SYNC (all clock types) 0010: Follow_Up (all clock types) 0011: Delay_Req (all clock types) 0100: Delay_Resp (all clock types) 0101: Pdelay_Req (in peer-to-peer transparent clock) 0110: Pdelay_Resp (in peer-to-peer transparent clock) 0111: Pdelay_Resp_Follow_Up (in peer-to-peer transparent clock) 1000: Announce 1001: Management 1010: Signaling 1011–1110: Reserved 1111: PTP packet with Reserved message type
7	IPCE	<p>IP Payload Error</p> <p>When this bit is set, it indicates either of the following:</p> <ul style="list-style-type: none"> – The 16-bit IP payload checksum (that is, the TCP, UDP, or ICMP checksum) calculated by the MAC does not match the corresponding checksum field in the received segment. – The TCP, UDP, or ICMP segment length does not match the payload length value in the IP Header field. – The TCP, UDP, or ICMP segment length is less than minimum allowed segment length for TCP, UDP, or ICMP. <p>Bit 15 (ES) of RDES3 is not set when this bit is set.</p>

Table 546. RDES1 normal descriptor (write-back format)⁽¹⁾ (continued)

Bit	Name	Description
6	IPCB	IP Checksum Bypassed This bit indicates that the checksum offload engine is bypassed.
5	IPV6	IPv6 header Present This bit indicates that an IPV6 header is detected.
4	IPV4	IPv4 Header Present This bit indicates that an IPV4 header is detected.
3	IPHE	IP Header Error – When this bit is set, it indicates either of the following: – The 16-bit IPv4 header checksum calculated by the MAC does not match the received checksum bytes. – The IP datagram version is not consistent with the Ethernet Type value. – Ethernet packet does not have the expected number of IP header bytes. This bit is valid when either bit 5 or bit 4 is set.
2:0	PT	Payload Type These bits indicate the type of payload encapsulated in the IP datagram processed by the Receive Checksum Offload Engine (COE): 000: Unknown type or IP/AV payload not processed 001: UDP 010: TCP 011: ICMP 100: IGMP if IPV4 Header Present bit is set 110: AV Tagged Data Packet 111: AV Tagged Control Packet 101: AV Untagged Control Packet Others: reserved. If the COE does not process the payload of an IP datagram because there is an IP header error or fragmented IP, it sets these bits to 3'b000.

1. The Status fields in write-back format are valid only for the last descriptor (RDES3[28] is set).

- RDES2 normal descriptor (write-back format)

17	DAF	<p>Destination Address Filter Fail</p> <p>When this bit is set, it indicates that the packet failed the DA Filter in the MAC.</p>
16	SAF	<p>SA Address Filter Fail</p> <p>When this bit is set, it indicates that the packet failed the SA Filter in the MAC.</p>

Table 547. RDES2 normal descriptor (write-back format) (continued)

Bit	Name	Description
15	VF	VLAN Filter Status When this bit is set, it indicates that the VLAN Tag of received packet passed the VLAN filter.
14:11	Reserved	
10	ARPNR	ARP Reply Not Generated When this bit is set, it indicates that the MAC did not generate the ARP Reply for received ARP Request packet. This bit is set when the MAC is busy transmitting ARP reply to earlier ARP request (only one ARP request is processed at a time).
9:0	Reserved	

- RDES3 normal descriptor (write-back format)

Table 548. RDES3 normal descriptor (write-back format)

Bit	Name	Description
31	OWN	Own bit 1: The DMA owns the descriptor. 0: The application owns the descriptor. The DMA clears this bit when either of the following conditions is true: The DMA completes the packet reception The buffers associated with the descriptor are full
30	CTXT	Receive Context Descriptor When this bit is set, it indicates that the current descriptor is a context type descriptor. The DMA writes 0 to this bit for normal receive descriptor. When CTXT and FD bits are used together, {CTXT, FD} possible values are: 00: Intermediate Descriptor 01: First Descriptor 10: Reserved 11: Descriptor error (due to all 1s) <i>Note: When a Descriptor error occurs, the Receive DMA closes the receive descriptor indicating a Descriptor error. This receive descriptor is skipped and the buffer addresses are not used to write the packet data. The receive DMA sets the CDE field of the Channel i status register (ETH_DMACiSR) but does not set the RI field, even when IOC field is set, as this is not marked as last receive descriptor for the packet. The subsequent valid receive descriptor is used to write the packet data.</i>

Table 548. RDES3 normal descriptor (write-back format) (continued)

Bit	Name	Description
29	FD	<p>First Descriptor</p> <p>When this bit is set, it indicates that this descriptor contains the first buffer of the packet. If the size of the first buffer is 0, the second buffer contains the beginning of the packet. If the size of the second buffer is also 0, the next descriptor contains the beginning of the packet.</p> <p>Refer to the CTXT bit description for details on how to use the CTXT bit and FD bit together.</p>
28	LD	<p>Last Descriptor</p> <p>When this bit is set, it indicates that the buffers to which this descriptor is pointing are the last buffers of the packet.</p>
27	RS2V	<p>Receive Status RDES2 Valid</p> <p>When this bit is set, it indicates that the status in RDES2 is valid and it is written by the DMA. This bit is valid only when the LD bit of RDES3 is set.</p>
26	RS1V	<p>Receive Status RDES1 Valid</p> <p>When this bit is set, it indicates that the status in RDES1 is valid and it is written by the DMA. This bit is valid only when the LD bit of RDES3 is set.</p>
25	RS0V	<p>Receive Status RDES0 Valid</p> <p>When this bit is set, it indicates that the status in RDES0 is valid and it is written by the DMA. This bit is valid only when the LD bit of RDES3 is set.</p>
24	CE	<p>CRC Error</p> <p>When this bit is set, it indicates that a Cyclic Redundancy Check (CRC) Error occurred on the received packet. This field is valid only when the LD bit of RDES3 is set.</p>
23	GP	<p>Giant Packet</p> <p>When this bit is set, it indicates that the packet length exceeds the specified maximum Ethernet size of 1518, 1522, or 2000 bytes (9018 or 9022 bytes if jumbo packet enable is set).</p> <p>Giant packet indicates only the packet length. It does not cause any packet truncation.</p>
22	RWT	<p>Receive Watchdog Timeout</p> <p>When this bit is set, it indicates that the Receive Watchdog Timer has expired while receiving the current packet. The current packet is truncated after watchdog timeout.</p>
21	OE	<p>Overflow Error</p> <p>When this bit is set, it indicates that the received packet is damaged because of buffer overflow in Rx FIFO.</p> <p>This bit is set only when the DMA transfers a partial packet to the application. This happens only when the Rx FIFO is operating in the threshold mode. In the store-and-forward mode, all partial packets are dropped completely in Rx FIFO.</p>

Table 548. RDES3 normal descriptor (write-back format) (continued)

Bit	Name	Description
20	RE	<p>Receive Error</p> <p>When this bit is set, it indicates that the ETH_RX_ER signal is asserted while the ETH_RX_DV signal is asserted during packet reception. This error also includes carrier extension error in the GMII and Half-duplex mode. Error can be of less or no extension, or error (rxd!= 0f) during extension.</p>
19	DE	<p>Dribble Bit Error</p> <p>When this bit is set, it indicates that the received packet has a non-integer multiple of bytes (odd nibbles). This bit is valid only in the MII Mode.</p>
18:16	LT	<p>Length/Type Field</p> <p>This field indicates if the packet received is a length packet or a type packet. The encoding of the 3 bits is as follows:</p> <p>000: The packet is a length packet 001: The packet is a type packet. 011: The packet is a ARP Request packet type 100: The packet is a type packet with VLAN Tag 101: The packet is a type packet with Double VLAN tag 110: The packet is a MAC Control packet type 111: The packet is a OAM packet type 010: Reserved</p>
15	ES	<p>Error Summary</p> <p>When this bit is set, it indicates the logical OR of the following bits:</p> <p>RDES3[19]: Dribble Error RDES3[20]: Receive Error RDES3[21]: Overflow Error RDES3[22]: Watchdog Timeout RDES3[23]: Giant Packet RDES3[24]: CRC Error</p> <p>This field is valid only when the LD bit of RDES3 is set.</p>
14:0	PL	<p>Packet Length</p> <p>These bits indicate the byte length of the received packet that was transferred to system memory (including CRC).</p> <p>This field is valid when both the LD bit of RDES3 is set and the Overflow Error bit is reset. The packet length also includes the two bytes appended to the Ethernet packet when IP checksum calculation is enabled and the received packet is not a MAC control packet.</p> <p>When LD bit of RDES3 is reset, this field contains the accumulated number of bytes (partial) that have been transferred for the current packet.</p>

Receive context descriptor

This descriptor is read-only for the application. This descriptor can be written only by the DMA.

The context descriptor provides information about the extended status related to the last received packet. Bit 30 of RDES3 indicates the context type descriptor.

Figure 816 shows the format for Receive context descriptors. Table 549 to Table 552 provide a detailed description of all Receive context descriptors.

Figure 816. Receive context descriptor

- RDES0 context descriptor

Table 549. RDES0 context descriptor

Bit	Name	Description
31:0	RTSL	Receive Packet Timestamp Low The DMA updates this field with least significant 32 bits of the timestamp captured for corresponding Receive packet. When this field and the RTSH field of RDES1 show all-ones value, the timestamp must be considered as corrupt.

- RDES1 context descriptor

Table 550. RDES1 context descriptor

Bit	Field	Description
31:0	RTSH	Receive Packet Timestamp High The DMA updates this field with most significant 32 bits of the timestamp captured for corresponding receive packet. When this field and the RTSL field of RDES0 show all-ones value, the timestamp must be considered as corrupt.

- RDES2 context descriptor

Table 551. RDES2 context descriptor

Bit	Description
31:0	Reserved

- RDES3 context descriptor

Table 552. RDES3 context descriptor

Bit	Name	Description
31	OWN	Own Bit 1: The DMA owns the descriptor 0: The application owns the descriptor. The DMA clears this bit when either of the following conditions is true: The DMA completes the packet reception The buffers associated with the descriptor are full
30	CTXT	Receive Context Descriptor When this bit is set, it indicates that the current descriptor is a context descriptor. The DMA writes 1'b1 to this bit for context descriptor.
29:0		Reserved

64.11 Ethernet registers

64.11.1 Ethernet registers maps

This section provides the following register maps:

- DMA registers (see [Section 64.11.2: Ethernet DMA registers](#))
- MTL registers (see [Section 64.11.3: Ethernet MTL registers](#))
- MAC registers including MMC register (see [Section 64.11.4: Ethernet MAC and MMC registers](#))

64.11.2 Ethernet DMA registers

DMA mode register (ETH_DMAMR)

Address offset: 0x1000

Reset value: 0x0000 0000

The DMA mode register establishes the bus operating modes for the DMA.

				rw			rw				r	r	r		rw

Bits 31:18 Reserved, must be kept at reset value.

Bits 17:16 **INTM[1:0]**: Interrupt Mode

This field defines the interrupt mode of the Ethernet peripheral.

The behavior of the interrupt signal and of the RI/TI bits in the ETH_DMAMCSR register changes depending on the INTM value (refer to [Table 528: Transfer complete interrupt behavior](#)).

Bits 15:12 Reserved, must be kept at reset value.

Bit 11 **TXPR**: Transmit priority

When set, this bit indicates that the Tx DMA has higher priority than the Rx DMA during arbitration for the system-side bus.

Bits 10:9 Reserved, must be kept at reset value.

Bit 8 **DSPW**: Descriptor Posted Write

When this bit is set to

0: The descriptor writes are always non-posted.

1: The descriptor writes are non-posted only when IOC (Interrupt on completion) is set in last descriptor. Otherwise, the descriptor writes are always posted.

Bits 7:5 Reserved, must be kept at reset value.

Bits 4:2 **TAA[2:0]**: Transmit Arbitration Algorithm

This field is used to select the arbitration algorithm for the Transmit side when multiple Tx DMAs are selected.

000: Fixed priority. In fixed priority, Channel 0 has the lowest priority and the last channel has the highest priority.

001: Weighted Strict priority (WSP)

010: Weighted Round-Robin (WRR)

011 to 111: Reserved, must not be used.

Bit 1 Reserved, must be kept at reset value.

Bit 0 **SWR**: Software Reset

When this bit is set, the MAC and the DMA controller reset the logic and all internal registers of the DMA, MTL, and MAC. This bit is automatically cleared after the reset operation is complete in all clock domains. Before reprogramming any register, a value of zero should be read in this bit.

Note: The reset operation is complete only when all resets in all active clock domains are deasserted. Therefore, it is essential that all PHY inputs clocks (applicable for the selected PHY interface) are present for software reset completion. The time to complete the software reset operation depends on the frequency of the slowest active clock.

System bus mode register (ETH_DMASBMR)

Address offset: 0x1004

Reset value: 0x0101 0000

The System bus mode register controls the behavior of the AXI master. It mainly controls burst splitting and number of outstanding requests.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
EN_LPI	LPI_XIT_PKT	Res.	Res.	Res.	Res.	WR_OSR_LMT [1:0]		Res.	Res.	Res.	Res.	Res.	Res.	RD_OSR_LMT [1:0]

		rw	rw		rw			rw	rw	rw	rw	rw	rw	rw	rw

- Bit 31 EN_LPI:** Enable Low Power Interface (LPI)
 When set to 1, this bit enables the LPI mode and accepts the LPI request from the AXI System Clock controller.
 When set to 0, this bit disables the LPI mode and always denies the LPI request from the AXI System Clock controller.
- Bit 30 LPI_XIT_PKT:** Unlock on Magic Packet or Remote wakeup Packet
 When set to 1, this bit enables the AXI master to come out of the LPI mode only when the magic packet or remote wakeup packet is received. When set to 0, this bit enables the AXI master to come out of the LPI mode when any packet is received.
- Bits 29:26 Reserved, must be kept at reset value.
- Bits 25:24 **WR_OSR_LMT[1:0]:** AXI Maximum Write Outstanding Request Limit
 This value limits the maximum outstanding request on the AXI write interface. Maximum outstanding requests = WR_OSR_LMT + 1.
- Bits 23:18 Reserved, must be kept at reset value.
- Bits 17:16 **RD_OSR_LMT[1:0]:** AXI Maximum Read Outstanding Request Limit
 This value limits the maximum outstanding request on the AXI read interface. Maximum outstanding requests = RD_OSR_LMT + 1
- Bits 15:14 Reserved, must be kept at reset value.
- Bit 13 ONEKBBE:** 1 Kbyte Boundary Crossing Enable for the AXI Master
 When set, the burst transfers performed by the AXI master do not cross 1 Kbyte boundary.
 When reset, the burst transfers performed by the AXI master do not cross 4 Kbyte boundary.
- Bit 12 AAL:** Address-Aligned Beats
 When this bit is set to 1, the master performs address-aligned burst transfers on Read and Write channels.
- Bit 11 Reserved, must be kept at reset value.
- Bit 10 AALE:** Automatic AXI LPI enable
 When set to 1, enables the AXI master to enter into LPI state when there is no activity in the Ethernet peripheral for a number of system clock cycles programmed in the LPIEI field of ETH_DMALPIEI register.
- Bits 9:8 Reserved, must be kept at reset value.

- Bit 7 **BLEN256**: AXI Burst Length 256
When this bit is set to 1, the AXI master can select a burst length of 256 on the AXI interface.
- Bit 6 **BLEN128**: AXI Burst Length 128
When this bit is set to 1, the AXI master can select a burst length of 128 on the AXI interface.
- Bit 5 **BLEN64**: AXI Burst Length 64
When this bit is set to 1, the AXI master can select a burst length of 64 on the AXI interface.
- Bit 4 **BLEN32**: AXI Burst Length 32
When this bit is set to 1, the AXI master can select a burst length of 32 on the AXI interface.
- Bit 3 **BLEN16**: AXI Burst Length 16
When this bit is set to 1 or the FB bit is set to 0, the AXI master can select a burst length of 16 on the AXI interface.
When the FB bit is set to 0, setting this bit has no effect.
- Bit 2 **BLEN8**: AXI Burst Length 8
When this bit is set to 1 or the FB bit is set to 0, the AXI master can select a burst length of 8 on the AXI interface.
When the FB bit is set to 0, setting this bit has no effect.
- Bit 1 **BLEN4**: AXI Burst Length 4
When this bit is set to 1 or the FB bit is set to 0, the AXI master can select a burst length of 4 on the AXI interface.
When the FB bit is set to 0, setting this bit has no effect.
- Bit 0 **FB**: Fixed Burst Length
When this bit is set to 1, the AXI master initiates burst transfers of specified lengths as given below.
- Burst transfers of fixed burst lengths as indicated by the BLEN256, BLEN128, BLEN64, BLEN32, BLEN16, BLEN8, or BLEN4 field
 - Burst transfers of length 1: when this bit is set to 0, the AXI master initiates burst transfers that are equal to or less than the maximum allowed burst length programmed in Bits[7:1].

Interrupt status register (ETH_DMAISR)

Address offset: 0x1008

Reset value: 0x0000 0000

The application reads this Interrupt Status register during interrupt service routine or polling to determine the interrupt status of DMA channels, MTL queues, and the MAC.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

														r	r

Bits 31:18 Reserved, must be kept at reset value.

Bit 17 **MACIS**: MAC Interrupt Status

This bit indicates an interrupt event in the MAC. To reset this bit to 1'b0, the software must read the corresponding register in the MAC to get the exact cause of the interrupt and clear its source.

Bit 16 **MTLIS**: MTL Interrupt Status

This bit indicates an interrupt event in the MTL. To reset this bit to 1'b0, the software must read the corresponding register in the MTL to get the exact cause of the interrupt and clear its source.

Bits 15:2 Reserved, must be kept at reset value.

Bit 1 **DC1IS**: DMA Channel 1 Interrupt Status

This bit indicates an interrupt event in DMA Channel 1. To reset this bit to 0, the software must read the corresponding register in DMA Channel 1 to get the exact cause of the interrupt and clear its source.

Bit 0 **DC0IS**: DMA Channel 0 Interrupt Status

This bit indicates an interrupt event in DMA Channel 0. To reset this bit to 0, the software must read the corresponding register in DMA Channel 0 to get the exact cause of the interrupt and clear its source.

Debug status register (ETH_DMADSR)

Address offset: 0x100C

Reset value: 0x0000 0000

The Debug status register gives the Receive and Transmit process status for DMA Channel 0 and Channel 1 for debugging purpose.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TPS1[3:0]				RPS1[3:0]

r	r	r	r	r	r	r	r							r	r

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:20 **TPS1[3:0]**: DMA Channel 1 Transmit Process State

This field indicates the Tx DMA FSM state for Channel 1. This field is similar to the TPS0 field.

Bits 19:16 **RPS1[3:0]**: DMA Channel 1 Receive Process State

This field indicates the Rx DMA FSM state for Channel 1. This field is similar to the RPS0 field.

Bits 15:12 **TPS0[3:0]**: DMA Channel 0 Transmit Process State

This field indicates the Tx DMA FSM state for Channel 0:

000: Stopped (Reset or Stop Transmit Command issued)

001: Running (Fetching Tx Transfer Descriptor)

010: Running (Waiting for status)

011: Running (Reading Data from system memory buffer and queuing it to the Tx buffer (Tx FIFO))

100: Timestamp write state

101: Reserved for future use

110: Suspended (Tx Descriptor Unavailable or Tx Buffer Underflow)

111: Running (Closing Tx Descriptor)

The MSB of this field always returns 0. This field does not generate an interrupt.

Bits 11:8 **RPS0[3:0]**: DMA Channel 0 Receive Process State

This field indicates the Rx DMA FSM state for Channel 0:

000: Stopped (Reset or Stop Receive Command issued)

001: Running (Fetching Rx Transfer Descriptor)

010: Reserved for future use

011: Running (Waiting for Rx packet)

100: Suspended (Rx Descriptor Unavailable)

101: Running (Closing the Rx Descriptor)

110: Timestamp write state

111: Running (Transferring the received packet data from the Rx buffer to the system memory)

The MSB of this field always returns 0. This field does not generate an interrupt.

Bits 7:2 Reserved, must be kept at reset value.

Bit 1 **AXRHSTS**: AXI Master Read Channel Status

When high, this bit indicates that the read channel of the AXI master is active, and it is transferring the data.

Bit 0 **AXWHSTS**: AXI Master Write Channel

When high, this bit indicates that the write channel of the AXI master is active, and it is transferring data.

AXI4 transmit channel ACE control register (ETH_DMAA4TXACR)

Address offset: 0x1020

Reset value: 0x0000 0000

This register is used to control the AXI4 Cache Coherency Signals for read transactions by all the Transmit DMA channels. The following signals of the AXI4 interface are driven with different values as programmed for corresponding type (descriptor, buffer1, buffer2) of access:

- arcache_m_o[3:0]

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

				rw	rw	rw	rw					rw	rw	rw	rw

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:16 **THC[3:0]**: Transmit DMA First Packet Buffer or TSO Header Cache Control

When TSO is NOT enabled, This field is used to drive arcache_o[3:0] signal when Transmit DMA is accessing First Buffer of the Packet (First valid buffer with FD being set in the TDES3 of the Descriptor).

When TSO is enabled, This field is used to drive arcache_o[3:0] signal when the Transmit DMA is accessing the TSO Header data.

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:8 **TEC[3:0]**: Transmit DMA Extended Packet Buffer or TSO Payload Cache Control

When TSO is NOT enabled, This field is used to drive arcache_o[3:0] signal when Transmit DMA is accessing the extended buffers (when packet is distributed across multiple buffers).

When TSO is enabled, This field is used to drive arcache_o[3:0] signal when the Transmit DMA is accessing the TSO payload data.

Bits 7:4 Reserved, must be kept at reset value.

Bits 3:0 **TDRC[3:0]**: Transmit DMA Read Descriptor Cache Control

This field is used to drive arcache_o[3:0] signal when Transmit DMA engines access the Descriptor.

AXI4 receive channel ACE control register (ETH_DMAA4RXACR)

Address offset: 0x1024

Reset value: 0x0000 0000

This register is used to control the AXI4 Cache Coherency Signals for write transactions by all the Receive DMA channels. The following signals of the AXI4 interface are driven with different values as programmed for corresponding type (descriptor, buffer1, buffer2) of access:

- awcache_m_o[3:0]

Res.	Res.	Res.	Res.	RPC[3:0]				Res.	Res.	Res.	Res.	RDWC[3:0]			
				rw	rw	rw	rw					rw	rw	rw	rw

Bits 31:28 Reserved, must be kept at reset value.

Bits 27:24 **RDC[3:0]**: Receive DMA Buffer Cache Control

This field is used to drive awcache_o[3:0] signal when Receive DMA is accessing the Buffer when Header and payload are NOT separated.

Bits 23:20 Reserved, must be kept at reset value.

Bits 19:16 **RHC[3:0]**: Receive DMA Header Cache Control

This field is used to drive awcache_o[3:0] and signal when Receive DMA is accessing the header Buffer when Header and payload are separated.

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:8 **RPC[3:0]**: Receive DMA Payload Cache Control

This field is used to drive awcache_o[3:0] signal when Receive DMA is accessing the Payload Buffer when Header and payload are separated.

Bits 7:4 Reserved, must be kept at reset value.

Bits 3:0 **RDWC[3:0]**: Receive DMA Write Descriptor Cache Control

This field is used to drive awcache_o[3:0] signal when Receive DMA accesses the Descriptor.

AXI4 descriptor ACE control register (ETH_DMAA4DACR)

Address offset: 0x1028

Reset value: 0x0000 0000

This register is used to control the AXI4 Cache Coherency Signals for Descriptor write transactions by all the TxDMA channels and Descriptor read transactions by all the RxDMA channels. It also controls the values to be driven on awprot_m_o and arprot_m_o.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bits 31:12 Reserved, must be kept at reset value.

Bits 11:8 **RDRC[3:0]**: Receive DMA Read Descriptor Cache control
 This field is used to drive arcache_o[3:0] signal when Receive DMA engines read the Descriptor.

Bits 7:6 Reserved, must be kept at reset value.

Bits 5:4 **TDWD[1:0]**: Transmit DMA Write Descriptor Domain control
 This field is used to drive awdomain_o[1:0] signal when Transmit DMA write to the Descriptor.

Bits 3:0 **TDWC[3:0]**: Transmit DMA Write Descriptor Cache control
 This field is used to drive awcache_o[3:0] signal when Transmit DMA writes to the Descriptor.

AXI4 LPI Entry Interval register (ETH_DMALPIEI)

Address offset: 0x1040

Reset value: 0x0000 0000

This register is used to control the AXI LPI entry interval.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	LPIEI[3:0]			
												rw	rw	rw	rw

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **LPIEI[3:0]**: LPI Entry Interval

Contains the number of system clock cycles, multiplied by 64, to wait for an activity in the peripheral to enter into the AXI low power state.
0 indicates 64 clock cycles.

Channel i control register (ETH_DMACiCR)

Address offset: 0x1100 + 0x80 * i, (i = 0 to 1)

Reset value: 0x0000 0000

The DMA Channel i control register specifies the MSS value for segmentation, length to skip between two descriptors, and also the features such as header splitting and 8xPBL mode.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DSL[2:0]			Res.	PBLX8
											rw	rw	rw		rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	MSS[13:0]													
		rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:21 Reserved, must be kept at reset value.

Bits 20:18 **DSL[2:0]**: Descriptor Skip Length

This bit specifies the 64-bit double-word number to skip between two unchained descriptors. The address skipping starts from the end of the current descriptor to the start of the next descriptor.
When the DSL value is equal to zero, the DMA takes the descriptor table as contiguous.

Bit 17 Reserved, must be kept at reset value.

Bit 16 **PBLX8**: 8xPBL mode

When this bit is set, the PBL value programmed in Bits[21:16] in *Channel i transmit control register (ETH_DMACiTXCR)* is multiplied eight times. Therefore, the DMA transfers the data in 8, 16, 32, 64, 128, and 256 beats depending on the PBL value.

Bits 15:14 Reserved, must be kept at reset value.

Bits 13:0 **MSS[13:0]**: Maximum Segment Size

This field specifies the maximum segment size that should be used while segmenting the packet. This field is valid only if the TSE bit of *Channel i transmit control register (ETH_DMACiTXCR)* is set.

The value programmed in this field must be more than the configured Data width in bytes. It is recommended to use a MSS value of 64 bytes or more.

Channel i transmit control register (ETH_DMACiTXCR)

Address offset: $0x1104 + 0x80 * i$, ($i = 0$ to 1)

Reset value: 0x0000 0000

The DMA Channel i Transmit Control register controls the Tx features such as PBL, TCP segmentation, and Tx Channel weights.

IPBL	Res.	Res.	TSE	Res.	Res.	Res.	Res.	Res.	Res.	Res.	OSF	TCW[2:0]		ST	
rw			rw								rw	r	r	r	rw

Bits 31:28 Reserved, must be kept at reset value.

Bits 27:24 **TQOS[3:0]**: Transmit QOS

This field is used to drive *arqos_m_o[3:0]* or *awqos_m_o[3:0]* output signals for all transactions of DMA Tx Channel i.

Bits 23:22 Reserved, must be kept at reset value.

Bits 21:16 **TXPBL[5:0]**: Transmit Programmable Burst Length

These bits indicate the maximum number of beats to be transferred in one DMA data transfer. This is the maximum value that is used in a single block Read or Write. The DMA always attempts to burst as specified in PBL each time it starts a burst transfer on the application bus. You can program PBL with any of the following values: 1, 2, 4, 8, 16, or 32. Any other value results in undefined behavior.

To transfer more than 32 beats, perform the following steps:

- a) Set the PBLx8 mode in ETH_DMACiCR.
- b) Set the TXPBL[5:0].

Note: The maximum value of TXPBL must be less than or equal to half the Tx Queue size (TQS field of *Tx queue i operating mode Register (ETH_MTLTXQiOMR)*) in terms of beats. This is required so that the Tx Queue has space to store at least another Tx PBL worth of data while the MTL Tx Queue Controller is transferring data to MAC. The total locations in Tx Queue of size 4096 bytes is 512, TXPBL and 8xPBL needs to be programmed to less than or equal to $512/2$.

Bit 15 **IPBL**: Ignore PBL Requirement

When this bit is set, the DMA does not check for PBL number of locations in the MTL before initiating a transfer. If space is not available, the MTL might use handshaking to slow the DMA.

Note: This bit/mode must not be used when multiple Transmit DMA Channels are enabled as it might block other Transmit and Receive DMA Channels from accessing the Read Data Channel of AXI bus until space is available in Transmit Queue for current transfer.

Bits 14:13 Reserved, must be kept at reset value.

Bit 12 **TSE**: TCP Segmentation Enabled

When this bit is set, the DMA performs the TCP segmentation for packets in Channel i. The TCP segmentation is done only for those packets for which the TSE bit (TDES0[19]) is set in the Tx Normal descriptor. When this bit is set, the TxPBL value must be greater than or equal to 4.

Bits 11:5 Reserved, must be kept at reset value.

Bit 4 **OSF**: Operate on Second Packet

When this bit is set, it instructs the DMA to process the second packet of the Transmit data even before the status for the first packet is obtained.

Bits 3:1 **TCW[2:0]**: Transmit Channel Weight

This field indicates the weight assigned to the corresponding Transmit channel. When reset is complete, this field is set to 0 for all channels by default, resulting in equal weights to all channels.

Bit 0 **ST**: Start or Stop Transmission Command

When this bit is set, transmission is placed in the Running state. The DMA checks the Transmit list at the current position for a packet to be transmitted.

The DMA tries to acquire descriptor from either of the following positions:

- The current position in the list: this is the base address of the Transmit list set by the ETH_DMACHiTXDLAR register.
- The position at which the transmission was previously stopped

If the DMA does not own the current descriptor, the transmission enters the Suspended state and the TBU bit of the ETH_DMACHiSR is set. The Start Transmission command is effective only when the transmission is stopped. If the command is issued before setting the ETH_DMACHiTXDLAR register, the DMA behavior is unpredictable.

When this bit is reset, the transmission process is placed in the Stopped state after completing the transmission of the current packet. The Next Descriptor position in the Transmit list is saved, and it becomes the current position when the transmission is restarted. To change the list address, you need to program ETH_DMACHiTXDLAR register with a new value when this bit is reset. The new value is considered when this bit is set again. The stop transmission command is effective only when the transmission of the current packet is complete or the transmission is in the Suspended state.

Channel 0 receive control register (ETH_DMARXCR)

Address offset: 0x1108

Reset value: 0x0000 0000

The DMA Channel 0 Receive Control register controls the Rx features such as PBL, buffer size, and extended status.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
RPF	Res	Res	Res	RQOS[3:0]				Res	Res	RXPBL[5:0]

Res.	RBSZ[13:0]														SR
	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 RPF: DMA Rx Channel 0 Packet Flush

When this bit is set to 1, the Ethernet peripheral automatically flushes the packet from the Rx queues destined to DMA Rx Channel 0 when the DMA Rx Channel 0 is stopped after a system bus error has occurred. When this bit remains set and the DMA is re-started by the software driver, the packets residing in the Rx Queues that were received when this RxDMA was stopped, are flushed out. The packets that are received by the MAC after the RxDMA is re-started are routed to the RxDMA. The flushing happens on the Read side of the Rx queue. When this bit is set to 0 the Ethernet peripheral does not flush the packet in the Rx queue destined to DMA Rx Channel 0 after the DMA is stopped due to a system bus error. This might cause head-of-line blocking in the corresponding RxQueue.

Note: The stopping of packet flow from a Rx DMA Channel to the application by setting RPF works only when there is one-to-one mapping of Rx Queue to Rx DMA channels. In Dynamic mapping mode, setting RPF bit in ETH_DMARXCR register might flush packets from unintended Rx Queues which are destined to the stopped Rx DMA Channel.

Bits 30:28 Reserved, must be kept at reset value.

Bits 27:24 RQOS[3:0]: Rx AXI4 QOS.

This field is used to drive arqos_m_o[3:0] or awqos_m_o[3:0] output signals for all transactions of DMA Rx Channel0.

Bits 23:22 Reserved, must be kept at reset value.

Bits 21:16 RXPBL[5:0]: Receive Programmable Burst Length

These bits indicate the maximum number of beats to be transferred in one DMA data transfer. This is the maximum value that is used in a single block Read or Write. The DMA always attempts to burst as specified in PBL each time it starts a burst transfer on the application bus. You can program PBL with any of the following values: 1, 2, 4, 8, 16, or 32. Any other value results in undefined behavior.

To transfer more than 32 beats, perform the following steps:

- a) Set the PBLx8 mode in the ETH_DMARXCR.
- b) Set the RXPBL[5:0].

Note: The maximum value of RXPBL must be less than or equal to half the Rx Queue size (RQS field of Rx queue i operating mode register (ETH_MTLRXQIOMR)) in terms of beats. This is required so that the Rx Queue has space to store at least another Rx PBL worth of data while the MTL Rx Queue Controller is transferring data to MAC. The total locations in Rx Queue of size 4096 bytes is 512, RXPBL and 8xPBL needs to be programmed to less than or equal to 512/2.

Bit 15 Reserved, must be kept at reset value.

Bits 14:1 **RBSZ[13:0]**: Receive Buffer size

This field indicates the size of the Rx buffers specified in bytes. The maximum buffer size is limited to 16 Kbytes.

Note: The buffer size must be a multiple of 8. This is required even if the value of buffer address pointer is not aligned to bus width. If the buffer size is not a multiple of 8, it may result into undefined behavior.

The LSB bits (2:0) are ignored and the DMA internally takes the LSB bits as all-zero. Therefore, these LSB bits are read-only (RO).

Bit 0 **SR**: Start or Stop Receive

When this bit is set, the DMA tries to acquire the descriptor from the Receive list and processes the incoming packets.

The DMA tries to acquire descriptor from either of the following positions:

- The current position in the list: this is the address set by the [Channel 0 Rx descriptor list address register \(ETH_DMARXDLAR\)](#).
- The position at which the Rx process was previously stopped

If the DMA does not own the current descriptor, the reception is suspended and the RBU bit of the ETH_DMARSR is set. The Start Receive command is effective only when the reception is stopped. If the command is issued before setting the [Channel 0 Rx descriptor list address register \(ETH_DMARXDLAR\)](#), the DMA behavior is unpredictable.

When this bit is reset, the Rx DMA operation is stopped after the transfer of the current packet. The next descriptor position in the Receive list is saved, and it becomes the current position after the Rx process is restarted. The Stop Receive command is effective only when the Rx process is in the Running (waiting for Rx packet) or Suspended state.

Channel i Tx descriptor list address register (ETH_DMACHiTXDLAR)

Address offset: $0x1114 + 0x80 * i$, (i = 0 to 1)

Reset value: 0x0000 0000

Channel i Tx Descriptor List Address register points the DMA to the start of Transmit descriptor list. The descriptor lists reside in the physical memory space of the application and must be Dword-aligned. The DMA internally converts it to bus width aligned address by making the corresponding LSB to low.

You can write to this register only when the Tx DMA has stopped, that is, the ST bit is set to zero in ETH_DMACHiTXCR register. When stopped, this register can be written with a new descriptor list address. When you set ST bit to 1, the DMA takes the newly-programmed descriptor base address. If this register is not changed when ST bit is set to 0, the DMA takes the descriptor address where it was stopped earlier.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

TDESLA[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	r	r	r

Bits 31:0 **TDESLA[31:0]**: Start of Transmit List

This field contains the base address of the first descriptor in the Transmit descriptor list. The DMA ignores the LSB bits (2:0) for 64-bit bus width and internally takes these bits as all-zero. Therefore, these LSB bits are read-only (RO).

Channel 0 Rx descriptor list address register (ETH_DMARXDLAR)

Address offset: 0x111C

Reset value: 0x0000 0000

The Channel 0 Rx Descriptor List Address register points the DMA to the start of Receive descriptor list.

This register points to the start of the Receive Descriptor List. The descriptor lists reside in the physical memory space of the application and must be Dword-aligned. The DMA internally converts it to bus width aligned address by making the corresponding LS bits low. Writing to this register is permitted only when reception is stopped. When stopped, this register must be written to before the receive Start command is given. You can write to this register only when Rx DMA has stopped, that is, SR bit is set to zero in *ETH_DMARXCR* register. When stopped, this register can be written with a new descriptor list address.

When you set the SR bit to 1, the DMA takes the newly programmed descriptor base address.

RDESLA[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	r	r	r

Bits 31:0 **RDESLA[31:0]**: Start of Receive List

This field contains the base address of the first descriptor in the Rx Descriptor list. The DMA ignores the LSB bits (2:0) for 64-bit bus width and internally takes these bits as all-zero. Therefore, these LSB bits are read-only (RO).

Channel i Tx descriptor tail pointer register (ETH_DMACiTXDTPR)

Address offset: $0x1120 + 0x80 * i$, ($i = 0$ to 1)

Reset value: $0x0000\ 0000$

The Channel i Tx Descriptor Tail Pointer register points to an offset from the base and indicates the location of the last valid descriptor.

TDT[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	r	r	r

Bits 31:0 **TDT[31:0]**: Transmit Descriptor Tail Pointer

This field contains the tail pointer for the Tx descriptor ring. The software writes the tail pointer to add more descriptors to the Tx channel. The hardware tries to transmit all packets referenced by the descriptors between the head and the tail pointer registers.

Channel 0 Rx descriptor tail pointer register (ETH_DMACH0RXDTPR)

Address offset: 0x1128

Reset value: 0x0000 0000

The Channel 0 Rx Descriptor Tail Pointer Points to an offset from the base and indicates the location of the last valid descriptor.

RDT[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	r	r	r

Bits 31:0 **RD[31:0]**: Receive Descriptor Tail Pointer

This field contains the tail pointer for the Rx descriptor ring. The software writes the tail pointer to add more descriptors to the Rx channel. The hardware tries to write all received packets to the descriptors referenced between the head and the tail pointer registers.

Channel i Tx descriptor ring length register (ETH_DMACHiTXRLR)

Address offset: 0x112C + 0x80 * i, (i = 0 to 1)

Reset value: 0x0000 0000

The Tx Descriptor Ring Length register contains the length of the Transmit descriptor ring.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.						rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:10 Reserved, must be kept at reset value.

Bits 9:0 **TDRL[9:0]**: Transmit Descriptor Ring Length

This field sets the maximum number of Tx descriptors in the circular descriptor ring. The maximum number of descriptors is limited to 1K descriptors. It is recommended to put a minimum ring descriptor length of 4.

For example, you can program any value up to 0x3FF in this field. This field is 10 bits wide, if you program 0x3FF, you can have 1024 descriptors. If you want to have 10 descriptors, program it to a value of 0x9.

Channel 0 Rx descriptor ring length register (ETH_DMARXRRLR)

Address offset: 0x1130

Reset value: 0x0000 0000

The Channel 0 Rx Descriptor Ring Length register contains the length of the Receive descriptor circular ring.

Res.	Res.	Res.	Res.	Res.	Res.	RDRL[9:0]									
						rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:17 **ARBS[6:0]**: Alternate Receive Buffer Size

Indicates size in bytes for Buffer 1 when ARBS[6:0] is programmed to a non-zero value. When ARBS[6:0] = 0, Rx Buffer1 and Rx Buffer2 sizes are based on RBSZ[13:0] field of [Channel 0 receive control register \(ETH_DMARXCR\)](#).

Bits 16:10 Reserved, must be kept at reset value.

Bits 9:0 **RDRL[9:0]**: Receive Descriptor Ring Length

This register sets the maximum number of Rx descriptors in the circular descriptor ring. The maximum number of descriptors is limited to 1K descriptors. For example, you can program any value up to 0x3FF in this field. This field is 10-bit wide. If you program 0x3FF, you can have 1024 descriptors. If you want to have 10 descriptors, program it to a value of 0x9.

Channel i interrupt enable register (ETH_DMARiIER)

Address offset: 0x1134 + 0x80 * i, (i = 0 to 1)

Reset value: 0x0000 0000

The Channel i Interrupt Enable register enables the interrupts reported by the Status register.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw				rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bit 15 **NIE**: Normal Interrupt Summary Enable

When this bit is set, the normal interrupt summary is enabled. This bit enables the following interrupts in the *Channel i status register (ETH_DMACiSR)*:

Bit 0: Transmit Interrupt

Bit 2: Transmit Buffer Unavailable

Bit 6: Receive Interrupt

Bit 11: Early Receive Interrupt

When this bit is reset, the normal interrupt summary is disabled.

Bit 14 **AIE**: Abnormal Interrupt Summary Enable

When this bit is set, the abnormal interrupt summary is enabled. This bit enables the following interrupts in the *Channel i status register (ETH_DMACiSR)*:

Bit 1: Transmit Process Stopped

Bit 7: Rx Buffer Unavailable

Bit 8: Receive Process Stopped

Bit 9: Receive Watchdog Timeout

Bit 10: Early Transmit Interrupt

Bit 12: Fatal Bus Error

When this bit is reset, the abnormal interrupt summary is disabled.

Bit 13 **CDEE**: Context Descriptor Error Enable

When this bit is set along with the AIE bit, the Context Descriptor error interrupt is enabled. When this bit is reset, the Context Descriptor error interrupt is disabled.

Bit 12 **FBEE**: Fatal Bus Error Enable

When this bit is set along with the AIE bit, the Fatal Bus error interrupt is enabled. When this bit is reset, the Fatal Bus Error error interrupt is disabled.

Bit 11 **ERIE**: Early Receive Interrupt Enable

When this bit is set along with the NIE bit, the Early Receive interrupt is enabled. When this bit is reset, the Early Receive interrupt is disabled.

Bit 10 **ETIE**: Early Transmit Interrupt Enable

When this bit is set along with the AIE bit, the Early Transmit interrupt is enabled. When this bit is reset, the Early Transmit interrupt is disabled.

Bit 9 **RWTE**: Receive Watchdog Timeout Enable

When this bit is set along with the AIE bit, the Receive Watchdog Timeout interrupt is enabled. When this bit is reset, the Receive Watchdog Timeout interrupt is disabled.

Bit 8 **RSE**: Receive Stopped Enable

When this bit is set along with the AIE bit, the Receive Stopped Interrupt is enabled. When this bit is reset, the Receive Stopped interrupt is disabled.

Bit 7 **RBUE**: Receive Buffer Unavailable Enable

When this bit is set along with the AIE bit, the Receive Buffer Unavailable interrupt is enabled. When this bit is reset, the Receive Buffer Unavailable interrupt is disabled.

Bit 6 **RIE**: Receive Interrupt Enable

When this bit is set along with the NIE bit, the Receive Interrupt is enabled. When this bit is reset, the Receive Interrupt is disabled.

Bits 5:3 Reserved, must be kept at reset value.

Bit 2 **TBUE**: Transmit Buffer Unavailable Enable

When this bit is set along with the NIE bit, the Transmit Buffer Unavailable interrupt is enabled. When this bit is reset, the Transmit Buffer Unavailable interrupt is disabled.

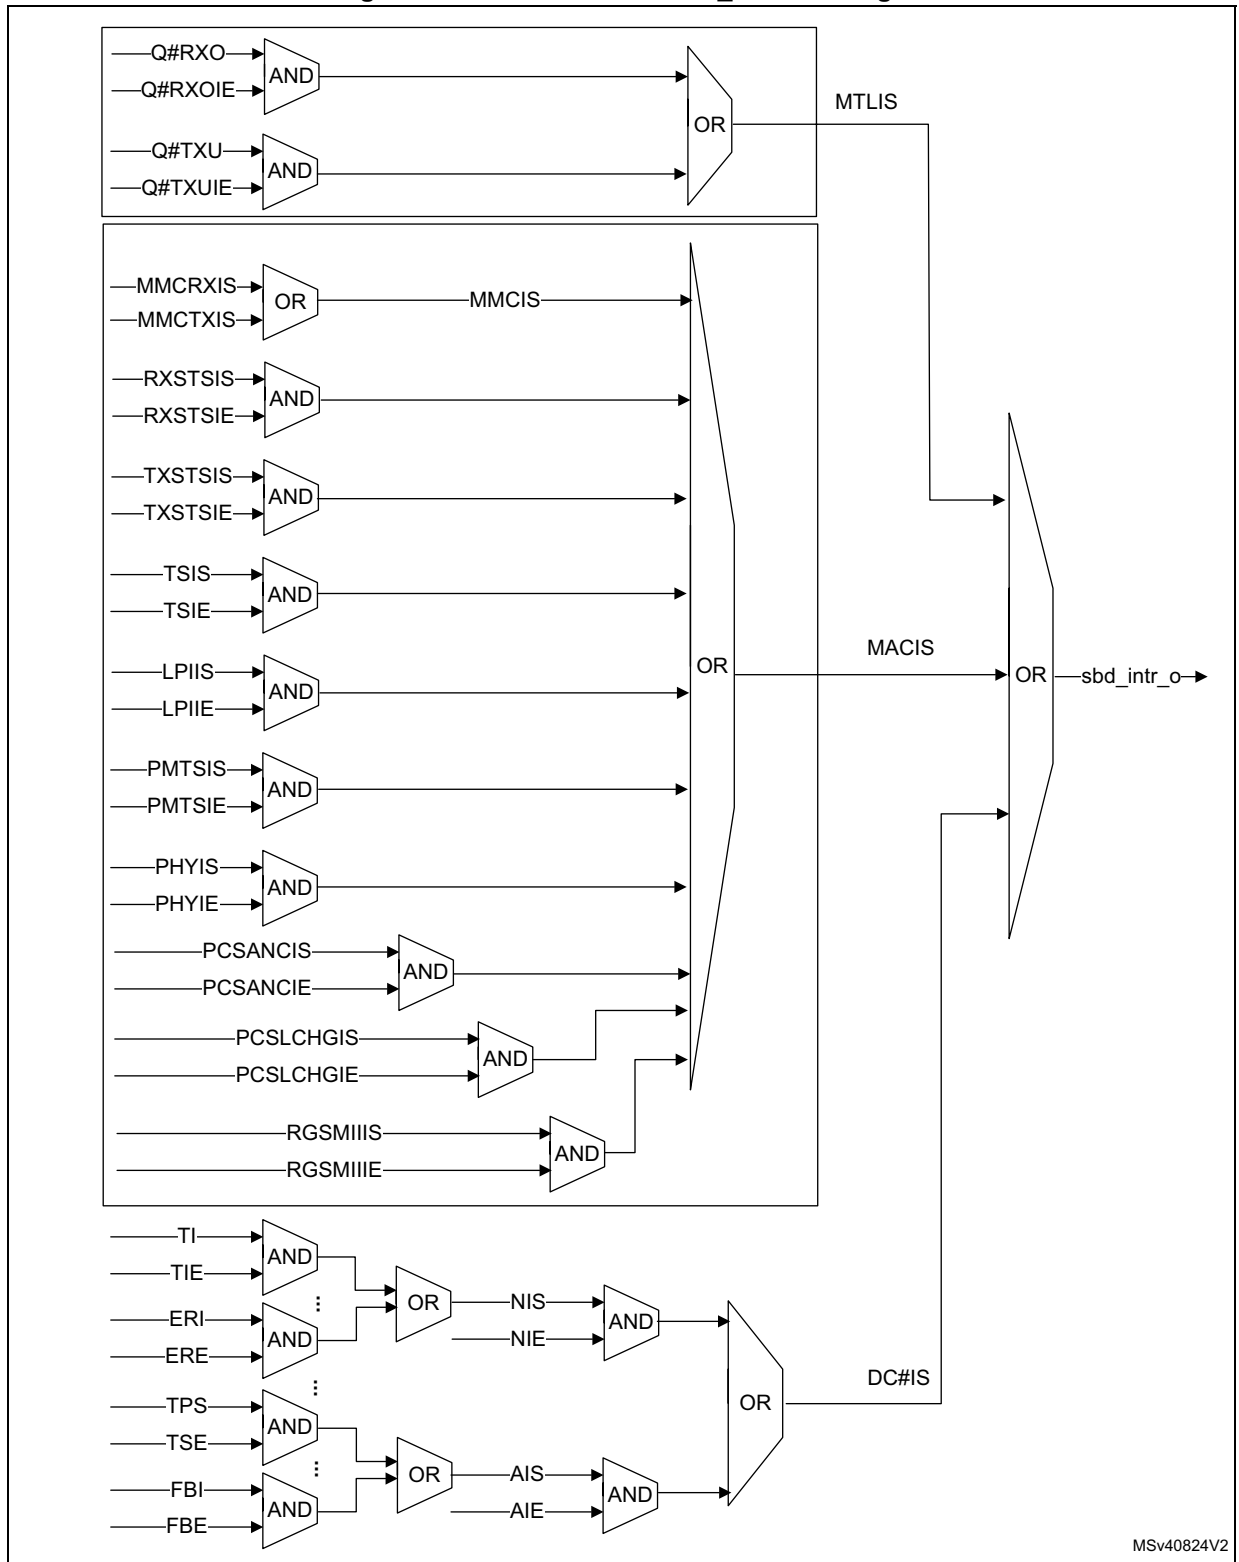

Bit 1 **TXSE**: Transmit Stopped Enable

When this bit is set along with the AIE bit, the Transmission Stopped interrupt is enabled. When this bit is reset, the Transmission Stopped interrupt is disabled.

Bit 0 **TIE**: Transmit Interrupt Enable

When this bit is set along with the NIE bit, the Transmit Interrupt is enabled. When this bit is reset, the Transmit Interrupt is disabled.

Figure 817. Generation of ETH_DMAISR flags

Channel 0 Rx interrupt watchdog timer register (ETH_DMARXIWTR)

Address offset: 0x1138

Reset value: 0x0000 0000

The Receive Interrupt Watchdog Timer register indicates the watchdog timeout for Receive Interrupt (RI) from the DMA. When this register is written with a non-zero value, it enables the watchdog timer for the RI bit of the *Channel i status register (ETH_DMARISR)*.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	RWTU[1:0]	
														rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	RWT[7:0]							
								rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:18 Reserved, must be kept at reset value.

Bits 17:16 **RWTU[1:0]**: Receive Interrupt Watchdog Timer Count Units

This field indicates the number of system clock cycles corresponding to one unit in RWT[7:0] field.

- 00: 256
- 01: 512
- 10: 1024
- 11: 2048

For example, when RWT[7:0] = 2 and RWTU[1:0] = 1, the watchdog timer is set for 2 * 512 = 1024 system clock cycles.

Bits 15:8 Reserved, must be kept at reset value.

Bits 7:0 **RWT[7:0]**: Receive Interrupt Watchdog Timer Count

This field indicates the number of system clock cycles, multiplied by factor indicated in RWTU field, for which the watchdog timer is set.

The watchdog timer is triggered with the programmed value after the Rx DMA completes the transfer of a packet for which the RI bit is not set in the ETH_DMARISR, because of the setting of Interrupt Enable bit in the corresponding descriptor RDES3[30].

When the watchdog timer runs out, the RI bit is set and the timer is stopped. The watchdog timer is reset when the RI bit is set high because of automatic setting of RI as per the Interrupt Enable bit RDES3[30] of any received packet.

Channel i slot function control status register (ETH_DMACiSFCSR)

Address offset: 0x113C + 0x80 * i, (i = 0 to 1)

Reset value: 0x0000 07C0

The Slot Function Control and Status register contains the control bits for slot function and the status for Transmit path.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	RSN[3:0]			
												r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SIV[11:0]												Res.	Res.	ASC	ESC
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw			rw	rw

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:16 **RSN[3:0]**: Reference Slot Number

This field gives the current value of the reference slot number in the DMA. It is used for slot comparison.

Bits 15:4 **SIV[11:0]**: Slot Interval Value

This field controls the period of the slot interval in which the TxDMA fetches the scheduled packets. A value of 0 specifies the slot interval of 1 μs while the maximum value 4095 specifies the slot interval of 4096 μs. The default/reset value is 0x07C which corresponds to slot interval of 125 μs.

Bits 3:2 Reserved, must be kept at reset value.

Bit 1 **ASC**: Advance Slot Check

When set, this bit enables the DMA to fetch the data from the buffer when the slot number (SLOTNUM) programmed in the Tx descriptor is

- equal to the reference slot number given in the RSN field

or

- ahead of the reference slot number by up to two slots

This bit is applicable only when the ESC bit is set.

Bit 0 **ESC**: Enable Slot Comparison

When set, this bit enables the checking of the slot numbers programmed in the Tx descriptor with the current reference given in the RSN field. The DMA fetches the data from the corresponding buffer only when the slot number is

- equal to the reference slot number

or

- ahead of the reference slot number by one slot

When reset, this bit disables the checking of the slot numbers. The DMA fetches the data immediately after the descriptor is processed.

Note: The UFO (UDP Fragmentation over IPv4)/TSO/USO should not be enabled along with TBS/AVB Slot number check. The UFO/TSO/USO involves multiple packets/segments/fragments transmission for single packet received from application and the slot number check are applicable for fetching of only first segment/fragment. As a result it might be difficult for the software to specify the slot number for subsequent packets.

Channel i current application transmit descriptor register (ETH_DMACiCATXDR)

Address offset: 0x1144 + 0x80 * i, (i = 0 to 1)

Reset value: 0x0000 0000

The Channel i Current Application Transmit Descriptor register points to the current Transmit descriptor read by the DMA.

Bits 31:0 **CURTDESAPTR[31:0]**: Application Transmit Descriptor Address Pointer
 The DMA updates this pointer during Tx operation. This pointer is cleared on reset.

Channel 0 current application receive descriptor register (ETH_DMAC0CARXDR)

Address offset: 0x114C

Reset value: 0x0000 0000

The Channel0 Current Application Receive Descriptor register points to the current Receive descriptor read by the DMA.

Bits 31:0 **CURRDESAPTR[31:0]**: Application Receive Descriptor Address Pointer
 The DMA updates this pointer during Rx operation. This pointer is cleared on reset.

Channel i current application transmit buffer register (ETH_DMACiCATXBR)

Address offset: 0x1154 + 0x80 * i, (i = 0 to 1)

Reset value: 0x0000 0000

The Channel i Current Application Transmit Buffer Address register points to the current Tx buffer address read by the DMA.

Bits 31:22 Reserved, must be kept at reset value.

Bits 21:19 **REB[2:0]**: Rx DMA Error Bits

This field indicates the type of error that caused a Bus Error. For example, error response on the AXI interface.

Bit [2]: Error during data transfer by Rx DMA when 1, no Error during data transfer by Rx DMA when 0.

Bit[1]: Error during descriptor access when 1, Error during data buffer access when 0

Bit[0]: Error during read transfer when 1, Error during write transfer when 0

This field is valid only when the FBE bit is set. This field does not generate an interrupt.

Bits 18:16 **TEB[2:0]**: Tx DMA Error Bits

This field indicates the type of error that caused a Bus Error. For example, error response on the AXI interface.

Bit[2]: Error during data transfer by Tx DMA when 1, no Error during data transfer by Tx DMA when 0

Bit[1]: Error during descriptor access when 1, Error during data buffer access when 0

Bit[0]: Error during read transfer when 1, Error during write transfer when 0

This field is valid only when the FBE bit is set. This field does not generate an interrupt.

Bit 15 **NIS**: Normal Interrupt Summary

Normal Interrupt Summary bit value is the logical OR of the following bits when the corresponding interrupt bits are enabled in the ETH_DMACEIER register:

Bit 0: Transmit Interrupt

Bit 2: Transmit Buffer Unavailable

Bit 6: Receive Interrupt

Bit 11: Early Receive Interrupt

Only unmasked bits (interrupts for which interrupt enable is set in ETH_DMACEIER register) affect the Normal Interrupt Summary bit.

This is a sticky bit. You must clear this bit (by writing 1 to this bit) each time a corresponding bit which causes NIS to be set is cleared.

Bit 14 **AIS**: Abnormal Interrupt Summary

Abnormal Interrupt Summary bit value is the logical OR of the following when the corresponding interrupt bits are enabled in the ETH_DMACEIER register:

Bit 1: Transmit Process Stopped

Bit 7: Receive Buffer Unavailable

Bit 8: Receive Process Stopped

Bit 10: Early Transmit Interrupt

Bit 12: Fatal Bus Error

Bit 13: Context Descriptor Error

Only unmasked bits affect the Abnormal Interrupt Summary bit.

This is a sticky bit. You must clear this bit (by writing 1 to this bit) each time a corresponding bit, which causes AIS to be set, is cleared.

Bit 13 **CDE**: Context Descriptor Error

This bit indicates that the DMA Tx/Rx engine received a descriptor error, which indicates invalid context in the middle of packet flow (intermediate descriptor) or all one's descriptor in Tx case and on Rx side it indicates DMA has read a descriptor with either of the buffer address as ones which is considered to be invalid.

Bit 12 **FBE**: Fatal Bus Error

This bit indicates that a bus error occurred (as described in the EB field). When this bit is set, the corresponding DMA channel engine disables all bus accesses.

- Bit 11 **ERI**: Early Receive Interrupt
This bit indicates that the DMA filled the first data buffer of the packet. The RI bit of this register automatically clears this bit.
- Bit 10 **ETI**: Early Transmit Interrupt
This bit indicates that the packet to be transmitted is fully transferred to the MTL Tx FIFO.
- Bit 9 **RWT**: Receive Watchdog Timeout
This bit is asserted when a packet with length greater than 2,048 bytes (10,240 bytes when Jumbo Packet mode is enabled) is received.
- Bit 8 **RPS**: Receive Process Stopped
This bit is asserted when the Rx process enters the Stopped state.
- Bit 7 **RBU**: Receive Buffer Unavailable
This bit indicates that the application owns the next descriptor in the Receive list, and the DMA cannot acquire it. The Rx process is suspended. To resume processing Rx descriptors, the application should change the ownership of the descriptor and issue a Receive Poll Demand command. If this command is not issued, the Rx process resumes when the next recognized incoming packet is received. In ring mode, the application should advance the Receive Descriptor Tail Pointer register of a channel. This bit is set only when the DMA owns the previous Rx descriptor.
- Bit 6 **RI**: Receive Interrupt
This bit indicates that the packet reception is complete. When packet reception is complete, Bit 31 of RDES1 is reset in the last descriptor, and the specific packet status information is updated in the descriptor.
The reception remains in the Running state.
- Bits 5:3 Reserved, must be kept at reset value.
- Bit 2 **TBU**: Transmit Buffer Unavailable
This bit indicates that the application owns the next descriptor in the Transmit list, and the DMA cannot acquire it. Transmission is suspended. The TPSi field of the [Debug status register \(ETH_DMADSR\)](#) register explains the Transmit Process state transitions.
To resume processing the Transmit descriptors, the application should do the following:
1. Change the ownership of the descriptor by setting Bit 31 of TDES3.
2. Issue a Transmit Poll Demand command.
For ring mode, the application should advance the Transmit Descriptor Tail Pointer register of a channel.
- Bit 1 **TPS**: Transmit Process Stopped
This bit is set when the transmission is stopped.
- Bit 0 **TI**: Transmit Interrupt
This bit indicates that the packet transmission is complete. When transmission is complete, Bit 31 of TDES3 is reset in the last descriptor, and the specific packet status information is updated in the descriptor.

Channel i missed frame count register (ETH_DMACiMFCR)

Address offset: 0x116C + 0x80 * i, (i = 0 to 1)

Reset value: 0x0000 0000

This register has the number of packet counter that got dropped by the DMA either due to Bus Error or due to programing RPF field in *Channel 0 receive control register (ETH_DMAC0RXCR)* register.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rc_r					rc_r	rc_r	rc_r	rc_r	rc_r	rc_r	rc_r	rc_r	rc_r	rc_r	rc_r

Bits 31:16 Reserved, must be kept at reset value.

Bit 15 **MFCO**: Overflow status of the MFC Counter

When this bit is set then the MFC counter does not get incremented further. The bit gets cleared when this register is read.

Bits 14:11 Reserved, must be kept at reset value.

Bits 10:0 **MFC[10:0]**: Dropped Packet Counters

This counter indicates the number of packet counters that are dropped by the DMA either because of bus error or because of programing RPF field in *Channel 0 receive control register (ETH_DMAC0RXCR)*. The counter gets cleared when this register is read.

Refer to [Section 2.5 on page 157](#) for the register boundary addresses.

64.11.3 Ethernet MTL registers

Operating mode Register (ETH_MTL0MR)

Address offset: 0x0C00

Reset value: 0x0000 0000

The Operating Mode register establishes the Transmit and Receive operating modes and commands.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	CNT CLR	CNT PRST	Res.	SCHALG[1:0]		Res.	Res.	RAA	DTX STS	Res.
						rw	rw		rw	rw			rw	rw	

Bits 31:10 Reserved, must be kept at reset value.

Bit 9 **CNTCLR**: Counters Reset

When this bit is set, all counters are reset. This bit is cleared automatically after 1 clock cycle. If this bit is set along with CNTPRST bit, CNTPRST has precedence.

Bit 8 **CNTPRST**: Counters Preset

When this bit is set:

- [Tx queue i underflow register \(ETH_MTLTXQiUR\)](#) is initialized/preset to 0x7F0.
- Missed Packet and Overflow Packet counters in [Rx queue i missed packet and overflow counter register \(ETH_MTLRXQiMPOCR\)](#) is initialized/preset to 0x7F0

This bit is cleared automatically.

Bit 7 Reserved, must be kept at reset value.

Bits 6:5 **SCHALG[1:0]**: Tx Scheduling Algorithm

This field indicates the algorithm for Tx scheduling:

- 00: Weighted round robin (WRR) algorithm
- 01 to 10: Reserved, must not be used.
- 11: Strict priority (SP) algorithm.

Bits 4:3 Reserved, must be kept at reset value.

Bit 2 **RAA**: Receive Arbitration Algorithm

This field is used to select the arbitration algorithm for the Rx side.

- 0: Strict priority (SP). Queue 0 has the lowest priority and the last queue has the highest priority.
- 1: Weighted Strict priority (WSP)

Bit 1 **DTXSTS**: Drop Transmit Status

When this bit is set, the Tx packet status received from the MAC is dropped in the MTL. When this bit is reset, the Tx packet status received from the MAC is forwarded to the application.

Bit 0 Reserved, must be kept at reset value.

Interrupt status Register (ETH_MTLISR)

Address offset: 0x0C20

Reset value: 0x0000 0000

The software driver (application) reads this register during interrupt service routine or polling to determine the interrupt status of MTL queues and the MAC.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Q1IS	Q0IS
														r	r

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **Q1IS**: Queue 1 interrupt status

This bit indicates that an interrupt has been generated by Queue 1. To reset this bit, read ETH_MTLQ1ICSR register to identify the interrupt cause and clear the source.

Bit 0 **Q0IS**: Queue 0 interrupt status

This bit indicates that an interrupt has been generated by Queue 0. To reset this bit, read ETH_MTLQ0ICSR register to identify the interrupt cause and clear the source.

Tx queue i operating mode Register (ETH_MTLTXQiOMR)

Address offset: 0x0D00 + 0x40 * i, (i = 0 to 1)

Reset value: 0x0000 0000

The Queue i Transmit Operating Mode register establishes the Transmit queue operating modes and commands.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TQS[3:0]			
												rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TTC[2:0]			TXQEN[1:0]		TSF	FTQ
									rw	rw	rw	rw	rw	rw	rw

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:16 **TQS[3:0]**: Transmit queue size

This field indicates the size of the allocated transmit queues in blocks of 256 bytes. Queue size range from 256 bytes (TQS=0b0000) to 4096 bytes (TQS=0b1111).

Bits 15:7 Reserved, must be kept at reset value.

Bits 6:4 **TTC[2:0]**: Transmit Threshold Control

These bits control the threshold level of the MTL Tx queue. The transmission starts when the packet size within the MTL Tx queue is larger than the threshold. In addition, full packets with length less than the threshold are also transmitted. These bits are used only when the TSF bit is reset.

- 000: 32
- 001: 64
- 010: 96
- 011: 128
- 100: 192
- 101: 256
- 110: 384
- 111: 512

Bits 3:2 **TXQEN[1:0]**: Transmit Queue Enable

This field is used to enable/disable the transmit queue 0.

- 00: Not enabled
- 01: Enable in AV mode
- 10: Enabled
- Others: Reserved, must not be used.

Note: In multiple Tx queues configuration, all the queues are disabled by default. Enable the Tx queue by programming this field.

Bit 1 **TSF**: Transmit Store and Forward

When this bit is set, the transmission starts when a full packet resides in the MTL Tx queue. When this bit is set, the TTC values specified in Bits[6:4] of this register are ignored. This bit should be changed only when the transmission is stopped.

Bit 0 **FTQ**: Flush Transmit Queue

When this bit is set, the Tx queue controller logic is reset to its default values. Therefore, all the data in the Tx queue is lost or flushed. This bit is internally reset when the flushing operation is complete. Until this bit is reset, you should not write to the ETH_MTLTXQ1OMR register. The data which is already accepted by the MAC transmitter is not flushed. It is scheduled for transmission and results in underflow and runt packet transmission.

Note: The flush operation is complete only when the Tx queue is empty and the application has accepted the pending Tx Status of all transmitted packets. To complete this flush operation, the PHY Tx clock (eth_mii_tx_clk) should be active.

Tx queue i underflow register (ETH_MTLTXQiUR)

Address offset: 0x0D04 + 0x40 * i, (i = 0 to 1)

Reset value: 0x0000 0000

The Queue i Underflow Counter register contains the counter for packets aborted because of Transmit queue underflow and packets missed because of Receive queue packet flush

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	UFCNT OVF	UFFRMCNT[10:0]										
				rc_r	rc_r	rc_r	rc_r	rc_r	rc_r	rc_r	rc_r	rc_r	rc_r	rc_r	rc_r

Bits 31:12 Reserved, must be kept at reset value.

Bit 11 **UFCNTOVF**: Overflow Bit for Underflow Packet Counter

This bit is set every time the Tx queue Underflow Packet Counter field overflows, that is, it has crossed the maximum count. In such a scenario, the overflow packet counter is reset to all-zeros and this bit indicates that the rollover happened.

Bits 10:0 **UFFRMCNT[10:0]**: Underflow Packet Counter

This field indicates the number of packets aborted by the controller because of Tx queue Underflow. This counter is incremented each time the MAC aborts outgoing packet because of underflow. The counter is cleared when this register is read.

Tx queue i debug Register (ETH_MTLTXQiDR)

Address offset: 0x0D08 + 0x40 * i, (i = 0 to 1)

Reset value: 0x0000 0000

The Queue i Transmit Debug register gives the debug status of various blocks related to the Transmit queue.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	STXSTS[2:0]			Res.	PTXQ[2:0]		
									r	r	r		r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TXSTS FSTS	TXQ STS	TWC STS	TRCSTS[1:0]		TXQPA USED
										r	r	r	r	r	r

Bits 31:23 Reserved, must be kept at reset value.

Bits 22:20 **STXSTS[2:0]**: Number of Status Words in Tx Status FIFO of Queue

This field indicates the current number of status in the Tx Status FIFO of this queue. When the DTXSTS bit of ETH_MTLQMR register is set to 1, this field does not reflect the number of status words in Tx Status FIFO.

Bit 19 Reserved, must be kept at reset value.

Bits 18:16 **PTXQ[2:0]**: Number of Packets in the Transmit Queue

This field indicates the current number of packets in the Tx queue. When the DTXSTS bit of *Operating mode Register (ETH_MTLQMR)* register is set to 1, this field does not reflect the number of packets in the Transmit queue.

Bits 15:6 Reserved, must be kept at reset value.

Bit 5 **TXSTSFSTS**: MTL Tx Status FIFO Full Status

When high, this bit indicates that the MTL Tx Status FIFO is full. Therefore, the MTL cannot accept any more packets for transmission.

Bit 4 **TXQSTS**: MTL Tx Queue Not Empty Status

When this bit is high, it indicates that the MTL Tx queue is not empty and some data is left for transmission.

Bit 3 **TWCSTS**: MTL Tx Queue Write Controller Status

When high, this bit indicates that the MTL Tx queue Write Controller is active, and it is transferring the data to the Tx queue.

Bits 2:1 **TRCSTS[1:0]**: MTL Tx Queue Read Controller Status

This field indicates the state of the Tx Queue Read Controller:

- 00: Idle state
- 01: Read state (transferring data to the MAC transmitter)
- 10: Waiting for pending Tx Status from the MAC transmitter
- 11: Flushing the Tx queue because of the Packet Abort request from the MAC

Bit 0 **TXQPAUSED**: Transmit Queue in Pause

When this bit is high and the Rx flow control is enabled, it indicates that the Tx queue is in the Pause condition (in the Full-duplex only mode) because of the following:

- Reception of the PFC packet for the priorities assigned to the Tx queue when PFC is enabled
- Reception of 802.3x Pause packet when PFC is disabled

Tx queue i ETS status Register (ETH_MTLTXQiESR)

Address offset: 0x0D14 + 0x40 * i, (i = 0 to 1)

Reset value: 0x0000 0000

The Queue i ETS Status register provides the average traffic transmitted in Queue i.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:0 **ABS[23:0]**: Average Bits per Slot

This field contains the average transmitted bits per slot.

Tx queue 0 quantum weight register (ETH_MTLTXQ0QWR)

Address offset: 0x0D18

Reset value: 0x0000 0000

This register contains the weight for the Weighted Round Robin (WRR) for Queue 0.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.									ISCQW[6:0]						
									r	r	r	r	r	r	r

Bits 31:7 Reserved, must be kept at reset value.

Bits 6:0 **ISCQW[6:0]**: Weights

If WRR algorithm is enabled for queue 0 generic traffic, this field contains the weight for queue 0. The maximum value is 0x64.

Queue i interrupt control status Register (ETH_MTLQiCSR)

Address offset: 0x0D2C + 0x40 * i, (i = 0 to 1)

Reset value: 0x0000 0000

This register contains the interrupt enable and status bits for the queue i interrupts.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

						rw	rw							rw	rc_w1

Bits 31:25 Reserved, must be kept at reset value.

Bit 24 **RXOIE**: Receive Queue Overflow Interrupt Enable

When this bit is set, the Receive Queue Overflow interrupt is enabled. When this bit is reset, the Receive Queue Overflow interrupt is disabled.

Bits 23:17 Reserved, must be kept at reset value.

Bit 16 **RXOVFIS**: Receive Queue Overflow Interrupt Status

This bit indicates that the Receive Queue had an overflow while receiving the packet. If a partial packet is transferred to the application, the overflow status is set in RDES3[21]. This bit is cleared when the application writes 1 to this bit.

Bits 15:10 Reserved, must be kept at reset value.

Bit 9 **ABPSIE**: Average Bits Per Slot Interrupt Enable

When this bit is set, the MAC asserts the eth_sbd_intr_it interrupt when the average bits per slot status is updated.

When this bit is cleared, the interrupt is not asserted for such an event.

Bit 8 **TXUIE**: Transmit Queue Underflow Interrupt Enable

When this bit is set, the Transmit Queue Underflow interrupt is enabled. When this bit is reset, the Transmit Queue Underflow interrupt is disabled.

Bits 7:2 Reserved, must be kept at reset value.

Bit 1 **ABPSIS**: Average Bits Per Slot Interrupt Status

When set, this bit indicates that the MAC has updated the ABS value. This bit is cleared when the application writes 1 to this bit.

Note: This bit is automatically set after 10 ms in 1000 Mbps mode (100 ms in 100 Mbps), once the reset is released, regardless of the Ethernet controller configuration.

Bit 0 **TXUNFIS**: Transmit Queue Underflow Interrupt Status

This bit indicates that the Transmit Queue had an underflow while transmitting the packet. Transmission is suspended and an Underflow Error TDES3[2] is set. This bit is cleared when the application writes 1 to this bit.

Rx queue i operating mode register (ETH_MTLRXQiOMR)

Address offset: 0x0D30 + 0x40 * i, (i = 0 to 1)

Reset value: 0x0000 0000

The Queue i Receive operating Mode register establishes the Receive queue operating modes and command.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	RQS[3:0]				Res.	Res.	Res.	RFD[2]
								rw	rw	rw	rw				rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

rw	rw				rw	rw	rw	rw	rw	rw	rw	rw		rw	rw

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:20 **RQS[3:0]**: Receive Queue Size

This field indicates the size of the allocated Receive queues in blocks of 256 bytes. The size of the queues is (RQS + 1) * 256 bytes.

Bits 19:17 Reserved, must be kept at reset value.

Bits 16:14 **RFD[2:0]**: Threshold for Deactivating Flow Control (in Half-duplex and Full-duplex modes)

These bits control the threshold (fill-level of Rx queue) at which the flow control is deasserted after activation:

- 0: Full minus 1 Kbyte
- 1: Full minus 1.5 Kbyte
- 2: Full minus 2 Kbytes
- 3: Full minus 2.5 Kbytes
- 4: Full minus 3 Kbytes
- 5: Full minus 3.5 Kbytes
- Other values: reserved

The deassertion is effective only after flow control is asserted.

Note: The value must be programmed in such a way to make sure that the threshold is a positive number.

To have the flow control activated for a fill level of 3 Kbytes and deactivated when the fill level is 1 Kbyte, program:

RFA[2:0] = 0 (full - 1 Kbyte)

RFD[2:0] = 4 (full - 3 Kbytes)

Bits 13:11 Reserved, must be kept at reset value.

Bits 10:8 **RFA[2:0]**: Threshold for Activating Flow Control (in Half-duplex and Full-duplex)

These bits control the threshold (fill-level of Rx queue) at which the flow control is activated: For more information on encoding for this field, see RFD[2:0].

Bit 7 **EHFC**: Enable Hardware Flow Control

When this bit is set, the flow control signal operation, based on the fill-level of Rx queue, is enabled. When reset, the flow control operation is disabled.

Bit 6 DIS_TCP_EF: Disable Dropping of TCP/IP Checksum Error Packets

When this bit is set, the MAC does not drop the packets which only have the errors detected by the Receive Checksum Offload engine. Such packets have errors only in the encapsulated payload. There are no errors (including FCS error) in the Ethernet packet received by the MAC.

When this bit is reset, all error packets are dropped if the FEP bit is reset.

Bit 5 RSF: Receive Queue Store and Forward

When this bit is set, the Ethernet peripheral reads a packet from the Rx queue only after the complete packet has been written to it, ignoring the RTC field of this register. When this bit is reset, the Rx queue operates in the Threshold (cut-through) mode, subject to the threshold specified by the RTC field of this register.

Bit 4 FEP: Forward Error Packets

When this bit is reset, the Rx queue drops packets with error status (CRC error, receive error, watchdog timeout, or overflow). However, if the start byte (write) pointer of a packet is already transferred to the read controller side (in Threshold mode), the packet is not dropped.

When this bit is set, all packets except the runt error packets are forwarded to the application or DMA. If the RSF bit is set and the Rx queue overflows when a partial packet is written, the packet is dropped irrespective of the setting of this bit. However, if the RSF bit is reset and the Rx queue overflows when a partial packet is written, a partial packet may be forwarded to the application or DMA.

Bit 3 FUP: Forward Undersized Good Packets

When this bit is set, the Rx queue forwards the undersized good packets (packets with no error and length less than 64 bytes), including pad-bytes and CRC. When this bit is reset, the Rx queue drops all packets of less than 64 bytes, unless a packet is already transferred because of the lower value of Rx Threshold, for example, RTC = 01.

Bit 2 Reserved, must be kept at reset value.**Bits 1:0 RTC[1:0]:** Receive Queue Threshold Control

These bits control the threshold level of the MTL Rx queue (in bytes):

00: 64

01: 32

10: 96

11: 128

The received packet is transferred to the application or DMA when the packet size within the MTL Rx queue is larger than the threshold. In addition, full packets with length less than the threshold are automatically transferred.

This field is valid only when the RSF bit is zero. This field is ignored when the RSF bit is set to 1.

Rx queue i missed packet and overflow counter register (ETH_MTLRXQiMPOCR)

Address offset: 0x0D34 + 0x40 * i, (i = 0 to 1)

Reset value: 0x0000 0000

The Queue i missed packet and overflow counter registers contain the counter for packets missed because of Receive queue packet flush and packets discarded because of Receive queue overflow.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bits 31:28 Reserved, must be kept at reset value.

Bit 27 **MISCNTOVF**: Missed Packet Counter Overflow Bit

When set, this bit indicates that the Rx Queue Missed Packet Counter crossed the maximum limit.

Bits 26:16 **MISPKTCNT[10:0]**: Missed Packet Counter

This field indicates the number of packets missed by the Ethernet peripheral because the application requested to flush the packets for this queue. This counter is reset when this register is read.

This counter is incremented by 1 when the DMA discards the packet because of buffer unavailability.

Bits 15:12 Reserved, must be kept at reset value.

Bit 11 **OVFCNTOVF**: Overflow Counter Overflow Bit

When set, this bit indicates that the Rx Queue Overflow Packet Counter field crossed the maximum limit.

Bits 10:0 **OVFPKTCNT[10:0]**: Overflow Packet Counter

This field indicates the number of packets discarded by the Ethernet peripheral because of Receive queue overflow. This counter is incremented each time the Ethernet peripheral discards an incoming packet because of overflow. This counter is reset when this register is read.

Rx queue i debug register (ETH_MTLRXQiDR)

Address offset: 0x0D38 + 0x40 * i, (i = 0 to 1)

Reset value: 0x0000 0000

The Queue i Receive Debug register gives the debug status of various blocks related to the Receive queue.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

										r	r		r	r	r

Bits 31:30 Reserved, must be kept at reset value.

Bits 29:16 **PRXQ[13:0]**: Number of Packets in Receive Queue

This field indicates the current number of packets in the Rx queue. The theoretical maximum value for this field is 256Kbyte/16bytes = 16K Packets, that is, Max_Queue_Size/Min_Packet_Size.

Bits 15:6 Reserved, must be kept at reset value.

Bits 5:4 **RXQSTS[1:0]**: MTL Rx Queue Fill-Level Status

This field gives the status of the fill-level of the Rx queue:
 00: Rx queue empty
 01: Rx queue fill-level below flow-control deactivate threshold
 10: Rx queue fill-level above flow-control activate threshold
 11: Rx queue full

Bit 3 Reserved, must be kept at reset value.

Bits 2:1 **RRCSTS[1:0]**: MTL Rx Queue Read Controller State

This field gives the state of the Rx queue Read controller:
 00: Idle state
 01: Reading packet data
 10: Reading packet status (or timestamp)
 11: Flushing the packet data and status

Bit 0 **RWCSTS**: MTL Rx Queue Write Controller Active Status

When high, this bit indicates that the MTL Rx queue Write controller is active, and it is transferring a received packet to the Rx queue.

Rx queue i control register (ETH_MTLRXQiCR)

Address offset: 0x0D3C + 0x40 * i, (i = 0 to 1)

Reset value: 0x0000 0000

The Queue Receive Control register controls the receive arbitration and passing of received packets to the application.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	RXQ_FRM_ARBIT	RXQ_WEGT[2:0]		
												rw	rw	rw	rw

Bits 31:4 Reserved, must be kept at reset value.

Bit 3 RXQ_FRM_ARBIT: Receive Queue Packet Arbitration

When this bit is set, the Ethernet peripheral drives the packet data to the DMA such that the entire packet data of currently-selected queue is transmitted before switching to other queue. When this bit is reset, the Ethernet peripheral drives the packet data to the DMA such that the following amount of data of currently-selected queue is transmitted before switching to other queue:

- PBL amount of data
- or
- complete data of a packet

The status and the timestamp are not a part of the PBL data. Therefore, the Ethernet peripheral drives the complete status (including timestamp status) during first PBL request for the packet (in store-and-forward mode) or the last PBL request for the packet (in Threshold mode).

Bits 2:0 RXQ_WEGT[2:0]: Receive Queue Weight

This field indicates the weight assigned to the Rx queue i. The weight is used as the number of continuous PBL requests or contiguous packets (depending on the RXQ_FRM_ARBIT) allocated to the queue in one arbitration cycle.

This field needs to be programmed with one value less than the required weight, that is, reset value of 0 indicates weight of 1, value of 1 indicates weight of 2, and so on.

Note: The change in value of RXQ_WEGT takes effect only after the completion of current service round or when there is change from RAA=SP to RAA=WSP algorithm. This approach is taken so that there is smooth transition. For the RXQ_WEGT value to take effect at the start, the Rx queue i control register (ETH_MTLRXQiCR) must be programmed before the Rx queue i operating mode register (ETH_MTLRXQiOMR).

Tx queue 1 ETS control Register (ETH_MTLTXQ1ECR)

Address offset: 0x0D50

Reset value: 0x0000 0000

The Queue ETS Control register controls the enhanced transmission selection operation.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SLC[2:0]			CC	AVALG	Res.	Res.
									rw	rw	rw	rw	rw		

Bits 31:7 Reserved, must be kept at reset value.

Bits 6:4 **SLC[2:0]**: Slot Count

If the credit-based shaper algorithm is enabled, the software can program the number of slots (of 125 us duration) over which the average transmitted bits per slot, provided in *Tx queue i ETS status Register (ETH_MTLTXQiESR)*, need to be computed for Queue 1. The encoding is as follows:

- 000: 1 Slot
- 001: 2 Slots
- 010: 4 Slots
- 011: 8 Slots
- 100: 16 Slots
- 101 to 111: Reserved, must not be used.

Bit 3 **CC**: Credit Control

When this bit is set, the accumulated credit parameter in the credit-based shaper algorithm logic is not reset to zero when there is positive credit and no packet to transmit in Channel 1. The credit accumulates even when there is no packet waiting in Channel 1 and another channel is transmitting.

When this bit is reset, the accumulated credit parameter in the credit-based shaper algorithm logic is set to zero when there is positive credit and no packet to transmit in Channel 1. When there is no packet waiting in Channel 1 and other channel is transmitting, no credit is accumulated.

Bit 2 **AVALG**: AV Algorithm

When Queue 1 is programmed for AV, this field configures the scheduling algorithm for this queue:

This bit when set, indicates credit based shaper algorithm (CBS) is selected for Queue 1 traffic. When reset, strict priority is selected.

Bits 1:0 Reserved, must be kept at reset value.

Tx queue 1 quantum weight register (ETH_MTLTXQ1QWR)

Address offset: 0x0D58

Reset value: 0x0000 0000

This register contains the weights for the Weighted Round Robin (WRR) or IdleSlopeCredit for Queue 1.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	ISCQW[13:0]													
		rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:14 Reserved, must be kept at reset value.

Bits 13:0 **ISCQW[13:0]**: IdleSlopeCredit or Weights

idleSlopeCredit

When AV feature is enabled, this field contains the idleSlopeCredit value required for the credit-based shaper algorithm for queue 1. This is the rate of change of credit in bits per cycle (40 ns for 100 Mbps; 8 ns for 1000 Mbps) when the credit is increasing. The software should program this field with computed credit in bits per cycle scaled by 1,024. The maximum value is portTransmitRate, that is, 0x2000 in 1000 Mbps mode and 0x1000 in 100 Mbps mode.

Weights

If WRR algorithm is enabled for queue i generic traffic (not AVB), this field contains the weight for queue 1. The maximum value is 0x64. Bits [13:7] must be written to zero.

Note: In multiple Queue configuration this field must be programmed to some non-zero value when the two queues are enabled. This field need not be programmed when only Q0 is enabled. In general, when WRR algorithm is selected a non-zero value must be programmed on both Receive and Transmit. In Receive, the register is [Operating mode Register \(ETH_MTLQMR\)](#).

The weights programmed do not correspond to the number of packets but the fraction of bandwidth or time allocated for particular queue w.r.t. total BW or time.

Tx queue 1 send slope credit Register (ETH_MTLTXQ1SSCR)

Address offset: 0x0D5C

Reset value: 0x0000 0000

The sendSlopeCredit register contains the sendSlope credit value required for the credit-based shaper algorithm for the Queue.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	SSC[13:0]													
		rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:14 Reserved, must be kept at reset value.

Bits 13:0 **SSC[13:0]**: sendSlopeCredit Value

When AV operation is enabled, this field contains the sendSlopeCredit value required for credit-based shaper algorithm for Queue 1. This is the rate of change of credit in bits per cycle (40 ns and 8 ns for 100 Mbps and 1000 Mbps respectively) when the credit decreases. The software should program this field with computed credit in bits per cycle scaled by 1 024. The maximum value is portTransmitRate, that is 0x2000 in 1000 Mbps mode and 0x1000 in 100 Mbps mode. This field should be programmed with absolute sendSlopeCredit value. The credit-based shaper logic subtracts it from the accumulated credit when Channel 1 is selected for transmission.

Tx Queue 1 hiCredit register (ETH_MTLTXQ1HCR)

Address offset: 0x0D60

Reset value: 0x0000 0000

The hiCredit register contains the hiCredit value required for the credit-based shaper algorithm for the Queue.

HC[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:29 Reserved, must be kept at reset value.

Bits 28:0 **HC[28:0]**: hiCredit Value

This field contains the hiCredit value required for the credit-based shaper algorithm when the AV feature is enabled. This is the maximum value that can be accumulated in the credit parameter. This is specified in bits scaled by 1 024.

The maximum value is maxInterferenceSize, that is, best-effort maximum packet size (16 384 bytes or 131 072 bits). The value to be specified is 131 072 * 1 024 = 134 217 728 or 0x0800 0000.

Tx queue 1 loCredit register (ETH_MTLTXQ1LCR)

Address offset: 0x0D64

Reset value: 0x0000 0000

The loCredit register contains the loCredit value required for the credit-based shaper algorithm for the Queue.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

LC[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:29 Reserved, must be kept at reset value.

Bits 28:0 **LC[28:0]**: loCredit Value

When AV operation is enabled, this field contains the loCredit value required for the credit-based shaper algorithm. This is the minimum value that can be accumulated in the credit parameter. This is specified in bits scaled by 1 024. The maximum value is maxFrameSize transmitted from this queue, that is, $16\,384 * 8 * 1\,024 = 134\,217\,728$ or 0x0800 0000. Because it is a negative value, the programmed value is 2's complement of the value, that is, 0x1800 0000.

Refer to [Section 2.5 on page 157](#) for the register boundary addresses.

64.11.4 Ethernet MAC and MMC registers

Operating mode configuration register (ETH_MACCR)

Address offset: 0x0000

Reset value: 0x0000 8000

The MAC Configuration Register establishes the operating mode of the MAC.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w		r/w	r/w	r/w	r/w	r/w	r/w	r/w

Bit 31 ARPEN: ARP Offload Enable

When this bit is set, the MAC can recognize an incoming ARP request packet and schedules the ARP packet for transmission. It forwards the ARP packet to the application and also indicate the events in the RxStatus.

When this bit is reset, the MAC receiver does not recognize any ARP packet and indicates them as Type frame in the RxStatus.

Bits 30:28 SARC[2:0]: Source Address Insertion or Replacement Control

This field controls the source address insertion or replacement for all transmitted packets. Bit 30 specifies which MAC Address register (0 or 1) is used for source address insertion or replacement based on the values of Bits[29:28]:

010: the MAC inserts the content of the MAC Address 0 registers (*MAC Address 0 high register (ETH_MACA0HR)* and *MAC Address x low register (ETH_MACAxLR)*) in the SA field of all transmitted packets.

011: the MAC replaces the content of the MAC Address 0 registers (*MAC Address 0 high register (ETH_MACA0HR)* and *MAC Address x low register (ETH_MACAxLR)*) in the SA field of all transmitted packets.

110: the MAC inserts the content of the MAC Address 1 registers (*MAC Address x high register (ETH_MACAxHR)* and *MAC Address x low register (ETH_MACAxLR)*) in the SA field of all transmitted packets

111: the MAC replaces the content of the MAC Address 1 registers (*MAC Address x high register (ETH_MACAxHR)* and *MAC Address x low register (ETH_MACAxLR)*) in the SA field of all transmitted packets.

Others: Reserved, must not be used.

Note: Changes to this field take effect only on the start of a packet. If you write to this register field when a packet is being transmitted, only the subsequent packet can use the updated value, that is, the current packet does not use the updated value.

Bit 27 IPC: Checksum Offload

When set, this bit enables the IPv4 header checksum checking and IPv4 or IPv6 TCP, UDP, or ICMP payload checksum checking. When this bit is reset, the COE function in the receiver is disabled.

The Layer 3 and Layer 4 Packet Filter feature automatically selects the IPC Full Checksum Offload Engine on the Receive side. When this feature is enabled, you must set the IPC bit.

Bits 26:24 IPG[2:0]: Inter-Packet Gap

These bits control the minimum IPG between packets during transmission.

000: 96 bit times

001: 88 bit times

010: 80 bit times

...

111: 40 bit times

This range of minimum IPG is valid in Full-duplex mode.

In the Half-duplex mode, the minimum IPG can be configured only for 64-bit times (IPG = 100). Lower values are not considered.

When a JAM pattern is being transmitted because of backpressure activation, the MAC does not consider the minimum IPG.

The above function (IPG less than 96 bit times) is valid only when EIPGEN bit in ETH_MACECR register is reset. When EIPGEN is set, then the minimum IPG (greater than 96 bit times) is controlled as per the description given in EIPG field in ETH_MACECR register.

Bit 23 GPSLCE: Giant Packet Size Limit Control Enable

When this bit is set, the MAC considers the value in GPSL field in ETH_MACECR register to declare a received packet as Giant packet. This field must be programmed to more than 1,518 bytes. Otherwise, the MAC considers 1,518 bytes as giant packet limit.

When this bit is reset, the MAC considers a received packet as Giant packet when its size is greater than 1,518 bytes (1522 bytes for tagged packet).

The watchdog timeout limit, Jumbo Packet Enable and 2K Packet Enable have higher precedence over this bit, that is the MAC considers a received packet as Giant packet when its size is greater than 9,018 bytes (9,022 bytes for tagged packet) with Jumbo Packet Enabled and greater than 2,000 bytes with 2K Packet Enabled. The watchdog timeout, if enabled, terminates the received packet when watchdog limit is reached. Therefore, the programmed giant packet limit should be less than the watchdog limit to get the giant packet status.

Bit 22 S2KP: IEEE 802.3as Support for 2K Packets

When this bit is set, the MAC considers all packets with up to 2,000 bytes length as normal packets. When the JE bit is not set, the MAC considers all received packets of size more than 2K bytes as Giant packets.

When this bit is reset and the JE bit is not set, the MAC considers all received packets of size more than 1,518 bytes (1,522 bytes for tagged) as giant packets. For more information about how the setting of this bit and the JE bit impact the Giant packet status, see [Table 557: Giant Packet Status based on S2KP and JE Bits](#).

Note: When the JE bit is set, setting this bit has no effect on the giant packet status.

Bit 21 CST: CRC stripping for Type packets

When this bit is set, the last four bytes (FCS) of all packets of Ether type (type field greater than 1,536) are stripped and dropped before forwarding the packet to the application. This function is not valid when the IP Checksum Engine (Type 1) is enabled in the MAC receiver. This function is valid when Type 2 Checksum Offload Engine is enabled.

Note: For information about how the settings of the ACS bit and this bit impact the packet length, see [Table 558: Packet Length based on the CST and ACS bits](#).

- Bit 20 **ACS**: Automatic Pad or CRC Stripping
- When this bit is set, the MAC strips the Pad or FCS field on the incoming packets only if the value of the length field is less than 1,536 bytes. All received packets with length field greater than or equal to 1,536 bytes are passed to the application without stripping the Pad or FCS field.
- When this bit is reset, the MAC passes all incoming packets to the application, without any modification.
- Note: For information about how the settings of CST bit and this bit impact the packet length, see [Table 558: Packet Length based on the CST and ACS bits](#).*
- Bit 19 **WD**: Watchdog Disable
- When this bit is set, the MAC disables the watchdog timer on the receiver. The MAC can receive packets of up to 16,383 bytes.
- When this bit is reset, the MAC does not allow more than 2,048 bytes (10,240 if JE is set high) of the packet being received. The MAC cuts off any bytes received after 2,048 bytes.
- Bit 18 **BE**: Packet Burst Enable
- When this bit is set, the MAC allows packet bursting during transmission in the GMII Half-duplex mode.
- Bit 17 **JD**: Jabber Disable
- When this bit is set, the MAC disables the jabber timer on the transmitter. The MAC can transfer packets of up to 16,383 bytes.
- When this bit is reset, if the application sends more than 2,048 bytes of data (10,240 if JE is set high) during transmission, the MAC does not send rest of the bytes in that packet.
- Bit 16 **JE**: Jumbo Packet Enable
- When this bit is set, the MAC allows jumbo packets of 9,018 bytes (9,022 bytes for VLAN tagged packets) without reporting a giant packet error in the Rx packet status.
- For more information about how the setting of this bit and the JE bit impact the Giant packet status, see [Table 557: Giant Packet Status based on S2KP and JE Bits](#).
- Bit 15 **PS**: Port Select
- This bit selects the Ethernet line speed.
- 0: For 1000 Mbps operations
1: For 10 or 100 Mbps operations
- In 10 or 100 Mbps operations, this bit, along with Bit FES, selects the exact line speed.
- Bit 14 **FES**: MAC Speed
- This bit selects the speed in the 10/100 Mbps mode:
- 0: 10 Mbps
1: 100 Mbps
- Bit 13 **DM**: Duplex Mode
- When this bit is set, the MAC operates in the Full-duplex mode in which it can transmit and receive simultaneously.
- Bit 12 **LM**: Loopback Mode
- When this bit is set, the MAC operates in the loopback mode at GMII or MII. The GMII Rx clock input (eth_mii_rx_clk) is required for the loopback to work properly. This is because the Tx clock is not internally looped back.
- Bit 11 **ECRSFD**: Enable Carrier Sense Before Transmission in Full-duplex mode
- When this bit is set, the MAC transmitter checks the CRS signal before packet transmission in the Full-duplex mode. The MAC starts the transmission only when the CRS signal is low.
- When this bit is reset, the MAC transmitter ignores the status of the CRS signal.

Bit 10 DO: Disable Receive Own

When this bit is set, the MAC disables the reception of packets when the ETH_TX_EN is asserted in the Half-duplex mode. When this bit is reset, the MAC receives all packets given by the PHY.

This bit is not applicable in the Full-duplex mode. This bit is reserved and read-only (RO) with default value in the Full-duplex-only configurations.

Bit 9 DCRS: Disable Carrier Sense During Transmission

When this bit is set, the MAC transmitter ignores the GMII CRS signal during packet transmission in the Half-duplex mode. As a result, no errors are generated because of Loss of Carrier or No Carrier during transmission.

When this bit is reset, the MAC transmitter generates errors because of Carrier Sense. The MAC can even abort the transmission.

Bit 8 DR: Disable Retry

When this bit is set, the MAC attempts only one transmission. When a collision occurs on the GMII or MII interface, the MAC ignores the current packet transmission and reports a Packet Abort with excessive collision error in the Tx packet status.

When this bit is reset, the MAC retries based on the settings of the BL field. This bit is applicable only in the Half-duplex mode.

Bit 7 Reserved, must be kept at reset value.**Bits 6:5 BL[1:0]:** Back-Off Limit

The back-off limit determines the random integer number (r) of slot time delays (4,096 bit times for 1000 Mbps; 512 bit times for 10/100 Mbps) for which the MAC waits before rescheduling a transmission attempt during retries after a collision:

00: $k = \min(n, 10)$

01: $k = \min(n, 8)$

10: $k = \min(n, 4)$

11: $k = \min(n, 1)$

where n = retransmission attempt

The random integer r takes the value in the range $0 \leq r < 2^k$.

This bit is applicable only in the Half-duplex mode.

Bit 4 DC: Deferral Check

When this bit is set, the deferral check function is enabled in the MAC. The MAC issues a Packet Abort status, along with the excessive deferral error bit set in the Tx packet status, when the Tx state machine is deferred for more than 24,288 bit times in 10 or 100 Mbps mode.

If the MAC is configured for 1000 Mbps operation, the threshold for deferral is 155,680 bits times. Deferral begins when the transmitter is ready to transmit, but it is prevented because of an active carrier sense signal (CRS) on GMII or MII.

The defer time is not cumulative. For example, if the transmitter defers for 10,000 bit times because the CRS signal is active and the CRS signal becomes inactive, the transmitter transmits and collision happens. Because of collision, the transmitter needs to back off and then defer again after back off completion. In such a scenario, the deferral timer is reset to 0, and it is restarted.

When this bit is reset, the deferral check function is disabled and the MAC defers until the CRS signal goes inactive.

This bit is applicable only in the Half-duplex mode.

Bits 3:2 **PRELEN[1:0]**: Preamble Length for Transmit packets

These bits control the number of preamble bytes that are added to the beginning of every Tx packet. The preamble reduction occurs only when the MAC is operating in the Full-duplex mode.

- 00: 7 bytes of preamble
- 01: 5 bytes of preamble
- 10: 3 bytes of preamble
- 11: Reserved, must not be used

Bit 1 **TE**: Transmitter Enable

When this bit is set, the Tx state machine of the MAC is enabled for transmission on the GMII or MII interface. When this bit is reset, the MAC Tx state machine is disabled after it completes the transmission of the current packet. The Tx state machine does not transmit any more packets.

Bit 0 **RE**: Receiver Enable

When this bit is set, the Rx state machine of the MAC is enabled for receiving packets from the GMII or MII interface. When this bit is reset, the MAC Rx state machine is disabled after it completes the reception of the current packet. The Rx state machine does not receive any more packets from the GMII or MII interface.

[Table 557](#) shows how the settings of S2KP and JE bits of the ETH_MACCR register impact the giant packet status.

Table 557. Giant Packet Status based on S2KP and JE Bits⁽¹⁾

Length/Type Field	Received Packet Length	S2KP	JE	Giant Packet Status
Untagged packet	> 1,518	0	0	1
	> 2,000	1	0	1
	> 9,018	x	1	1
VLAN tagged packet	> 1,522	0	0	1
	> 2,000	1	0	1
	> 9,022	x	1	1

1. For all other combinations, the Giant Packet status is 0.

[Table 558](#) shows how the settings of the CST and ACS bits of the ETH_MACCR register impact whether CRC length is included in the packet length.

Table 558. Packet Length based on the CST and ACS bits

Received Packet Length	CST	ACS	FCS Stripping Done
< 1,536	x	0	No
	x	1	Yes (for Ethernet packets)
≥ 1,536	0	x	No
	1	x	Yes (for Type packets)

Extended operating mode configuration register (ETH_MACECR)

Address offset: 0x0004

Reset value: 0x0000 0000

The MAC Extended Configuration Register establishes the operating mode of the MAC.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	EIPG[4:0]				EIPGEN	Res.	Res.	Res.	Res.	Res.	Res.	USP	SPEN	DCRCC
		rw	rw	rw	rw	rw	rw						rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	GFSL[13:0]													
		rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:30 Reserved, must be kept at reset value.

Bits 29:25 **EIPG[4:0]**: Extended Inter-Packet Gap

The value in this field is applicable when the EIPGEN bit is set. This field (as Most Significant bits) along with IPG field in *Operating mode configuration register (ETH_MACCCR)*, gives the minimum IPG greater than 96 bit times in steps of 8 bit times. For example:

- EIPG = 0 and IPG = 0 give 104 bit times
- EIPG = 0 and IPG = 1 give 112 bit times
- EIPG = 0 and IPG = 2 give 120 bit times
- ..
- EIPG = 7 and IPG = 31 give 2144 bit times

Bit 24 **EIPGEN**: Extended Inter-Packet Gap Enable

When this bit is set, the MAC interprets EIPG field and IPG field in *Operating mode configuration register (ETH_MACCCR)* together as minimum IPG greater than 96 bit times in steps of 8 bit times.

When this bit is reset, the MAC ignores EIPG field and interprets IPG field in *Operating mode configuration register (ETH_MACCCR)* as minimum IPG less than or equal to 96 bit times in steps of 8 bit times.

Note: The extended Inter-Packet Gap feature must be enabled when operating in Full-duplex mode only. There may be undesirable effects on back-pressure function and frame transmission if it is enabled in Half-duplex mode.

Bits 23:19 Reserved, must be kept at reset value.

Bit 18 **USP**: Unicast Slow Protocol Packet Detect

When this bit is set, the MAC detects the Slow Protocol packets with unicast address of the station specified in the *MAC Address 0 high register (ETH_MACA0HR)* and MAC Address 0 low register *MAC Address x low register (ETH_MACAxLR)*. The MAC also detects the Slow Protocol packets with the Slow Protocols multicast address (01-80-C2-00-00-02).

When this bit is reset, the MAC detects only Slow Protocol packets with the Slow Protocol multicast address specified in the IEEE 802.3-2008, Section 5.

Bit 17 **SPEN**: Slow Protocol Detection Enable

When this bit is set, MAC processes the Slow Protocol packets (Ether Type 0x8809) and provides the Rx status. The MAC discards the Slow Protocol packets with invalid subtypes. When this bit is reset, the MAC forwards all error-free Slow Protocol packets to the application. The MAC considers such packets as normal Type packets.

Bit 16 **DCRCC**: Disable CRC Checking for Received Packets

When this bit is set, the MAC receiver does not check the CRC field in the received packets. When this bit is reset, the MAC receiver always checks the CRC field in the received packets.

Bits 15:14 Reserved, must be kept at reset value.

Bits 13:0 **GPSL[13:0]**: Giant Packet Size Limit

If the received packet size is greater than the value programmed in this field in units of bytes, the MAC declares the received packet as Giant packet. The value programmed in this field must be greater than or equal to 1,518 bytes. Any other programmed value is considered as 1,518 bytes.

For VLAN tagged packets, the MAC adds 4 bytes to the programmed value. For double VLAN tagged packets, the MAC adds 8 bytes to the programmed value. The value in this field is applicable when the GPSLCE bit is set in ETH_MACCR register.

Packet filtering control register (ETH_MACPFR)

Address offset: 0x0008

Reset value: 0x0000 0000

The MAC Packet Filter register contains the filter controls for receiving packets. Some of the controls from this register go to the address check block of the MAC which performs the first level of address filtering. The second level of filtering is performed on the incoming packet based on other controls such as Pass Bad Packets and Pass Control Packets.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
RA	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DNTU	IPFE	Res.	Res.	Res.	VTFE
r/w										r/w	r/w				r/w
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	HPF	SAF	SAIF	PCFF[1:0]		DBF	PM	DAIF	HMC	HUC	PR
					r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w

Bit 31 **RA**: Receive All

When this bit is set, the MAC Receiver module passes all received packets to the application, irrespective of whether they pass the address filter or not. The result of the SA or DA filtering is updated (pass or fail) in the corresponding bit in the Rx Status Word.

When this bit is reset, the Receiver module passes only those packets to the application that pass the SA or DA address filter.

Bits 30:22 Reserved, must be kept at reset value.

Bit 21 **DNTU**: Drop Non-TCP/UDP over IP Packets

When this bit is set, the MAC drops the non-TCP or UDP over IP packets. The MAC forward only those packets that are processed by the Layer 4 filter. When this bit is reset, the MAC forwards all non-TCP or UDP over IP packets.

- Bit 20 **IPFE**: Layer 3 and Layer 4 Filter Enable
When this bit is set, the MAC drops packets that do not match the enabled Layer 3 and Layer 4 filters. If Layer 3 or Layer 4 filters are not enabled for matching, this bit does not have any effect.
When this bit is reset, the MAC forwards all packets irrespective of the match status of the Layer 3 and Layer 4 fields.
- Bits 19:17 Reserved, must be kept at reset value.
- Bit 16 **VTFE**: VLAN Tag Filter Enable
When this bit is set, the MAC drops the VLAN tagged packets that do not match the VLAN Tag. When this bit is reset, the MAC forwards all packets irrespective of the match status of the VLAN Tag.
- Bits 15:11 Reserved, must be kept at reset value.
- Bit 10 **HPF**: Hash or Perfect Filter
When this bit is set, the address filter passes a packet if it matches either the perfect filtering or Hash filtering as set by the HMC or HUC bit.
When this bit is reset and the HUC or HMC bit is set, the packet is passed only if it matches the Hash filter.
- Bit 9 **SAF**: Source Address Filter Enable
When this bit is set, the MAC compares the SA field of the received packets with the values programmed in the enabled SA registers. If the comparison fails, the MAC drops the packet. When this bit is reset, the MAC forwards the received packet to the application with updated SAF bit of the Rx Status depending on the SA address comparison.
Note: According to the IEEE specification, Bit 47 of the SA is reserved. However, the MAC compares all 48 bits. The software driver should take this into consideration while programming the MAC address registers for SA.
- Bit 8 **SAIF**: SA Inverse Filtering
When this bit is set, the Address Check block operates in the inverse filtering mode for SA address comparison. If the SA of a packet matches the values programmed in the SA registers, it is marked as failing the SA Address filter.
When this bit is reset, if the SA of a packet does not match the values programmed in the SA registers, it is marked as failing the SA Address filter.
- Bits 7:6 **PCF[1:0]**: Pass Control Packets
These bits control the forwarding of all control packets (including unicast and multicast Pause packets).
00: The MAC filters all control packets from reaching the application.
01: The MAC forwards all control packets except Pause packets to the application even if they fail the Address filter.
10: The MAC forwards all control packets to the application even if they fail the Address filter.
11: The MAC forwards the control packets that pass the Address filter.
- Bit 5 **DBF**: Disable Broadcast Packets
When this bit is set, the AFM module blocks all incoming broadcast packets. In addition, it overrides all other filter settings.
When this bit is reset, the AFM module passes all received broadcast packets.
- Bit 4 **PM**: Pass All Multicast
When this bit is set, it indicates that all received packets with a multicast destination address (first bit in the destination address field is '1') are passed. When this bit is reset, filtering of multicast packet depends on HMC bit.

Bit 3 **DAIF**: DA Inverse Filtering

When this bit is set, the Address Check block operates in inverse filtering mode for the DA address comparison for both unicast and multicast packets. When this bit is reset, normal filtering of packets is performed.

Bit 2 **HMC**: Hash Multicast

When this bit is set, the MAC performs the destination address filtering of received multicast packets according to the Hash table.

When this bit is reset, the MAC performs the perfect destination address filtering for multicast packets, that is, it compares the DA field with the values programmed in DA registers.

Bit 1 **HUC**: Hash Unicast

When this bit is set, the MAC performs the destination address filtering of unicast packets according to the Hash table.

When this bit is reset, the MAC performs a perfect destination address filtering for unicast packets, that is, it compares the DA field with the values programmed in DA registers.

Bit 0 **PR**: Promiscuous Mode

When this bit is set, the Address Filtering module passes all incoming packets irrespective of the destination or source address. The SA or DA Filter Fails status bits of the Rx Status Word are always cleared when PR is set.

Watchdog timeout register (ETH_MACWTR)

Address offset: 0x000C

Reset value: 0x0000 0000

The Watchdog Timeout register controls the watchdog timeout for received packets.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	PWE	Res.	Res.	Res.	Res.	WTO[3:0]			
							rw					rw	rw	rw	rw

Bits 31:9 Reserved, must be kept at reset value.

Bit 8 **PWE**: Programmable Watchdog Enable

When this bit is set and the WD bit of the *Operating mode configuration register (ETH_MACCCR)* register is reset, the WTO field is used as watchdog timeout for a received packet. When this bit is cleared, the watchdog timeout for a received packet is controlled by setting of WD and JE bits in *Operating mode configuration register (ETH_MACCCR)* register.

Bits 7:4 Reserved, must be kept at reset value.

Bits 3:0 **WTO[3:0]**: Watchdog Timeout

When the PWE bit is set and the WD bit of the *Operating mode configuration register (ETH_MACCCR)* register is reset, this field is used as watchdog timeout for a received packet. If the length of a received packet exceeds the value of this field, such packet is terminated and declared as an error packet.

Encoding is as follows:

0x0: 2 Kbytes

0x1: 3 Kbytes

0x2: 4 Kbytes

0x3: 5 Kbytes

..

0xC: 14 Kbytes

0xD: 15 Kbytes

0xE: 16383 Bytes

0xF: Reserved, must not be used

Note: When the PWE bit is set, the value in this field should be more than 1,522 (0x05F2).

Otherwise, the IEEE 802.3-specified valid tagged packets are declared as error packets and then dropped.

Hash Table 0 register (ETH_MACHT0R)

Address offset: 0x0010

Reset value: 0x0000 0000

The Hash Table Register 0 contains the first lower 32 bits of the Hash table (64 bits).

The Hash table is used for group address filtering.

For Hash filtering, the content of the destination address in the incoming packet is passed through the CRC logic and the upper six bits of the CRC register are used to index the content of the Hash table. The most significant bits determines the register to be used (Hash Table Register 0 or 1) and the least significant five bits determine the bit within the register. For example, a hash value of 0b100000 selects Bit 0 of the Hash Table Register 1.

The Hash value of the destination address is calculated in the following way:

1. Calculate the 32-bit CRC for the DA (See IEEE 802.3, Section 3.2.8 for the steps to calculate CRC32).
2. Perform bitwise reversal for the value obtained in Step 1.
3. Take the upper 7 or 8 bits from the value obtained in Step 2.

If the corresponding bit value of the register is 1, the packet is accepted. Otherwise, it is rejected. If the PM bit is set in ETH_MACPFR, all multicast packets are accepted regardless of the multicast Hash values.

Bits 31:0 **HT31T0[31:0]**: MAC Hash Table First 32 Bits
 This field contains the first 32 Bits [31:0] of the Hash table.

Hash Table 1 register (ETH_MACHT1R)

Address offset: 0x0014

Reset value: 0x0000 0000

The Hash Table 1 register contains the upper 32 bits of the Hash table (64 bits).

The Hash table is used for group address filtering.

For Hash filtering, the content of the destination address in the incoming packet is passed through the CRC logic and the upper six bits of the CRC register are used to index the content of the Hash table. The most significant bits determines the register to be used (Hash Table Register 0 or 1) and the least significant five bits determine the bit within the register. For example, a hash value of 6'b100000 selects Bit 0 of the Hash Table Register 1.

The Hash value of the destination address is calculated in the following way:

1. Calculate the 32-bit CRC for the DA (See IEEE 802.3, Section 3.2.8 for the steps to calculate CRC32).
2. Perform bitwise reversal for the value obtained in Step 1.
3. Take the upper 7 or 8 bits from the value obtained in Step 2.

If the corresponding bit value of the register is 1, the packet is accepted. Otherwise, it is rejected. If the PM bit is set in ETH_MACPFR, all multicast packets are accepted regardless of the multicast Hash values.

Bits 31:0 **HT63T32[31:0]**: MAC Hash Table Second 32 Bits
 This field contains the second 32 Bits [63:32] of the Hash table.

VLAN tag register (ETH_MACVTR)

Address offset: 0x0050

Reset value: 0x0000 0000

The VLAN Tag register identifies the IEEE 802.1Q VLAN type packets.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
EIVLRXS	Res.	EIVLS[1:0]		ERIVLT	EDVLP	VTHM	EVLRXS	Res.	EIVLS[1:0]		DOVLT	ERSVLM	ESVL	VTIM	ETV
rw		rw	rw	rw	rw	rw	rw		rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
VL[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

- Bit 31 **EIVLRXS**: Enable Inner VLAN Tag in Rx Status
 When this bit is set, the MAC provides the inner VLAN Tag in the Rx status. When this bit is reset, the MAC does not provide the inner VLAN Tag in Rx status.
- Bit 30 Reserved, must be kept at reset value.
- Bits 29:28 **EIVLS[1:0]**: Enable Inner VLAN Tag Stripping on Receive
 This field indicates the stripping operation on inner VLAN Tag in received packet:
 00: Do not strip
 01: Strip if VLAN filter passes
 10: Strip if VLAN filter fails
 11: Always strip
- Bit 27 **ERIVLT**: Enable Inner VLAN Tag
 When this bit and the EDVLP field are set, the MAC receiver enables operation on the inner VLAN Tag (if present). When this bit is reset, the MAC receiver enables operation on the outer VLAN Tag (if present). The ERSVLM bit determines which VLAN type is enabled for filtering or matching. The ERSVLM bit and DOVLT bit determines which VLAN type is enabled for filtering.
- Bit 26 **EDVLP**: Enable Double VLAN Processing
 When this bit is set, the MAC enables processing of up to two VLAN Tags on Tx and Rx (if present). When this bit is reset, the MAC enables processing of up to one VLAN Tag on Tx and Rx (if present).
- Bit 25 **VTHM**: VLAN Tag Hash Table Match Enable
 When this bit is set, the most significant four bits of CRC of VLAN Tag are used to index the content of the ETH_MACVLANHTR register. A value of 1 in the VLAN Hash Table register, corresponding to the index, indicates that the packet matched the VLAN Hash table.
 When the ETV bit is set, the CRC of the 12-bit VLAN Identifier (VID) is used for comparison. When the ETV bit is reset, the CRC of the 16-bit VLAN tag is used for comparison.
 When this bit is reset, the VLAN Hash Match operation is not performed.
- Bit 24 **EVLRXS**: Enable VLAN Tag in Rx status
 When this bit is set, MAC provides the outer VLAN Tag in the Rx status. When this bit is reset, the MAC does not provide the outer VLAN Tag in Rx status.
- Bit 23 Reserved, must be kept at reset value.

- Bits 22:21 **EVLS[1:0]**: Enable VLAN Tag Stripping on Receive
This field indicates the stripping operation on the outer VLAN Tag in received packet:
00: Do not strip
01: Strip if VLAN filter passes
10: Strip if VLAN filter fails
11: Always strip
- Bit 20 **DOVLTC**: Disable VLAN Type Check
When this bit is set, the MAC does not check whether the VLAN Tag specified by the ERIVLT bit is of type S-VLAN or C-VLAN.
When this bit is reset, the MAC filters or matches the VLAN Tag specified by the ERIVLT bit only when VLAN Tag type is similar to the one specified by the ERSVLM bit.
- Bit 19 **ERSVLM**: Enable Receive S-VLAN Match
When this bit is set, the MAC receiver enables filtering or matching for S-VLAN (Type = 0x88A8) packets. When this bit is reset, the MAC receiver enables filtering or matching for C-VLAN (Type = 0x8100) packets.
The ERIVLT bit determines the VLAN tag position considered for filtering or matching.
- Bit 18 **ESVL**: Enable S-VLAN
When this bit is set, the MAC transmitter and receiver consider the S-VLAN packets (Type = 0x88A8) as valid VLAN tagged packets.
- Bit 17 **VTIM**: VLAN Tag Inverse Match Enable
When this bit is set, this bit enables the VLAN Tag inverse matching. The packets without matching VLAN Tag are marked as matched. When reset, this bit enables the VLAN Tag perfect matching. The packets with matched VLAN Tag are marked as matched.
- Bit 16 **ETV**: Enable 12-Bit VLAN Tag Comparison
When this bit is set, a 12-bit VLAN identifier is used for comparing and filtering instead of the complete 16-bit VLAN tag. Bits[11:0] of VLAN tag are compared with the corresponding field in the received VLAN-tagged packet. Similarly, when enabled, only 12 bits of the VLAN tag in the received packet are used for Hash-based VLAN filtering.
When this bit is reset, all 16 bits of the 15th and 16th bytes of the received VLAN packet are used for comparison and VLAN Hash filtering.
- Bits 15:0 **VL[15:0]**: VLAN Tag Identifier for Receive Packets
This field contains the 802.1Q VLAN tag to identify the VLAN packets. This VLAN tag identifier is compared to the 15th and 16th bytes of the packets being received for VLAN packets. The following list describes the bits of this field:
Bits[15:13]: User Priority
Bit 12: Canonical Format Indicator (CFI) or Drop Eligible Indicator (DEI)
Bits[11:0]: VLAN Identifier (VID) field of VLAN tag
When the ETV bit is set, only the VID is used for comparison.
If this field ([11:0] if ETV is set) is all zeros, the MAC does not check the 15th and 16th bytes for VLAN tag comparison and declares all packets with Type field value of 0x8100 or 0x88a8 as VLAN packets.

VLAN Hash table register (ETH_MACVHTR)

Address offset: 0x0058

Reset value: 0x0000 0000

When the VTHM bit of *VLAN tag register (ETH_MACVTR)* register is set, the 16-bit VLAN Hash Table register is used for group address filtering based on the VLAN tag. For Hash filtering, the content of the 16-bit VLAN tag or 12-bit VLAN ID (based on the ETV bit of *VLAN tag register (ETH_MACVTR)* register) in the incoming packet is passed through the CRC logic. The upper four bits of the calculated CRC are used to index the contents of the VLAN Hash table. For example, a Hash value of 1000 selects Bit 8 of the VLAN Hash table.

The Hash value of the destination address is calculated in the following way:

1. Calculate the 32-bit CRC for the VLAN tag or ID (For steps to calculate CRC32, see Section 3.2.8 of IEEE 802.3).
2. Perform bitwise reversal for the value obtained in step 1.
3. Take the upper four bits from the value obtained in step 2.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res	Res	Res	Res	Res	Res	Res	Res	Res	Res	Res	Res	Res	Res	Res	Res

VLHT[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **VLHT[15:0]**: VLAN Hash Table

This field contains the 16-bit VLAN Hash Table.

VLAN inclusion register (ETH_MACVIR)

Address offset: 0x0060

Reset value: 0x0000 0000

The VLAN Tag Inclusion or Replacement register contains the VLAN tag for insertion or replacement in the Transmit packets. It also contains the VLAN tag insertion controls.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	VLTi	CSV _L	VLP	VLC[1:0]

VLT[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:21 Reserved, must be kept at reset value.

Bit 20 **VLTi**: VLAN Tag Input

When this bit is set, it indicates that the VLAN tag to be inserted or replaced in Tx packet should be taken from the Tx descriptor.

Bit 19 **CSVL**: C-VLAN or S-VLAN

When this bit is set, S-VLAN type (0x88a8) is inserted or replaced in the 13th and 14th bytes of transmitted packets. When this bit is reset, C-VLAN type (0x8100) is inserted or replaced in the 13th and 14th bytes of transmitted packets.

- 0: C-LAN
- 1: S-LAN

Bit 18 **VLP**: VLAN Priority Control

When this bit is set, the control bits[17:16] are used for VLAN deletion, insertion, or replacement. When this bit is reset, bits[17:16] are ignored.

Bits 17:16 **VLC[1:0]**: VLAN Tag Control in Transmit Packets

- 00: No VLAN tag deletion, insertion, or replacement
- 01: VLAN tag deletion. The MAC removes the VLAN type (bytes 13 and 14) and VLAN tag (bytes 15 and 16) of all transmitted packets with VLAN tags.
- 10: VLAN tag insertion. The MAC inserts VLT in bytes 15 and 16 of the packet after inserting the Type value (0x8100 or 0x88a8) in bytes 13 and 14. This operation is performed on all transmitted packets, irrespective of whether they already have a VLAN tag.
- 11: VLAN tag replacement. The MAC replaces VLT in bytes 15 and 16 of all VLAN-type transmitted packets (Bytes 13 and 14 are 0x8100 or 0x88a8).

Note: Changes to this field take effect only on the start of a packet. If you write this register field when a packet is being transmitted, only the subsequent packet can use the updated value, that is, the current packet does not use the updated value.

Bits 15:0 **VLT[15:0]**: VLAN Tag for Transmit Packets

This field contains the value of the VLAN tag to be inserted or replaced. The value must only be changed when the transmit lines are inactive or during the initialization phase.

The following list describes the bits of this field:

- Bits[15:13]: User Priority
- Bit 12: Canonical Format Indicator (CFI) or Drop Eligible Indicator (DEI)
- Bits[11:0]: VLAN Identifier (VID) field of VLAN tag

Inner VLAN inclusion register (ETH_MACIVIR)

Address offset: 0x0064

Reset value: 0x0000 0000

The Inner VLAN Tag Inclusion or Replacement register contains the inner VLAN tag to be inserted or replaced in the Transmit packet. It also contains the inner VLAN tag insertion controls.

Bits 31:21 Reserved, must be kept at reset value.

Bit 20 **VLTi**: VLAN Tag Input

When this bit is set, it indicates that the VLAN tag to be inserted or replaced in Tx packet should be taken from the Tx descriptor

Bit 19 **CSVL**: C-VLAN or S-VLAN

When this bit is set, S-VLAN type (0x88A8) is inserted or replaced in the 13th and 14th bytes of transmitted packets. When this bit is reset, C-VLAN type (0x8100) is inserted or replaced in the 13th and 14th bytes of transmitted packets.

- 0: C-LAN
- 1: S-LAN

Bit 18 **VLP**: VLAN Priority Control

When this bit is set, the VLC field is used for VLAN deletion, insertion, or replacement. When this bit is reset, the VLC field is ignored.

Bits 17:16 **VLC[1:0]**: VLAN Tag Control in Transmit Packets

- 00: No VLAN tag deletion, insertion, or replacement
- 01: VLAN tag deletion

The MAC removes the VLAN type (bytes 17 and 18) and VLAN tag (bytes 19 and 20) of all transmitted packets with VLAN tags.

10: VLAN tag insertion

The MAC inserts VLT in bytes 19 and 20 of the packet after inserting the Type value (0x8100 or 0x88a8) in bytes 17 and 18. This operation is performed on all transmitted packets, irrespective of whether they already have a VLAN tag.

11: VLAN tag replacement

The MAC replaces VLT in bytes 19 and 20 of all VLAN-type transmitted packets (Bytes 17 and 18 are 0x8100 or 0x88a8).

Note: Changes to this field take effect only on the start of a packet. If you write to this register field when a packet is being transmitted, only the subsequent packet can use the updated value, that is, the current packet does not use the updated value.

Bits 15:0 **VLT[15:0]**: VLAN Tag for Transmit Packets

This field contains the value of the VLAN tag to be inserted or replaced. The value must only be changed when the transmit lines are inactive or during the initialization phase.

The following list describes the bits of this field:

Bits[15:13]: User Priority

Bit 12: Canonical Format Indicator (CFI) or Drop Eligible Indicator (DEI)

Bits[11:0]: VLAN Identifier (VID) field of VLAN tag

Tx Queue 0 flow control register (ETH_MACQ0TXFCR)

Address offset: 0x0070

Reset value: 0x0000 0000

The Flow Control register controls the generation and reception of the Control (Pause Command) packets by the Flow control module of the MAC. A Write to a register with the Busy bit set to 1 triggers the Flow Control block to generate a Pause packet. The fields of the control packet are selected as specified in the 802.3x specification, and the Pause Time value from this register is used in the Pause Time field of the control packet. The Busy bit remains set until the control packet is transferred onto the cable. The application must make sure that the Busy bit is cleared before writing to the register.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	
PT[15:0]																
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
Res	Res	Res	Res	Res	Res	Res	Res	DZPQ	PLT[2:0]				Res	Res	TFE	FCB_BPA
								rw	rw	rw	rw			rw	rw	

Bits 31:16 **PT[15:0]**: Pause Time

This field holds the value to be used in the Pause Time field in the Tx control packet. I

Bits 15:8 Reserved, must be kept at reset value.

Bit 7 **DZPQ**: Disable Zero-Quanta Pause

When this bit is set, it disables the automatic generation of the zero-quanta Pause packets.

When this bit is reset, normal operation with automatic zero-quanta Pause packet generation is enabled.

Bits 6:4 **PLT[2:0]**: Pause Low Threshold

This field configures the threshold of the Pause timer at which the input flow is checked for automatic retransmission of the Pause packet.

The threshold values should be always less than the Pause Time configured in Bits[31:16]. For example, if PT = 100H (256 slot times), and PLT = 001, a second Pause packet is automatically transmitted at 228 (256-28) slot times after the first Pause packet is transmitted.

The following list provides the threshold values for different values:

000: Pause Time minus 4 Slot Times (PT -4 slot times)

001: Pause Time minus 28 Slot Times (PT -28 slot times)

010: Pause Time minus 36 Slot Times (PT -36 slot times)

011: Pause Time minus 144 Slot Times (PT -144 slot times)

100: Pause Time minus 256 Slot Times (PT -256 slot times)

101: Pause Time minus 512 Slot Times (PT -512 slot times)

110 to 111: Reserved, must not be used

The slot time is defined as the time taken to transmit 512 bits (64 bytes) on the GMII or MII interface.

This (approximate) computation is based on the packet size (64, 1518, 2000, 9018, 16384, or 32768) + 2 Pause Packet Size + IPG in Slot Times.

Bits 3:2 Reserved, must be kept at reset value.

Bit 1 **TFE**: Transmit Flow Control Enable

Full-duplex mode: when this bit is set, the MAC enables the flow control operation to Tx Pause packets. When this bit is reset, the flow control operation in the MAC is disabled, and the MAC does not transmit any Pause packets.

Half-duplex mode: when this bit is set, the MAC enables the backpressure operation. When this bit is reset, the backpressure feature is disabled.

Bit 0 **FCB_BPA**: Flow Control Busy or Backpressure Activate

This bit initiates a Pause packet in the Full-duplex mode and activates the backpressure function in the Half-duplex mode if the TFE bit is set.

Full-Duplex mode: this bit should be read as 0 before writing to this register. To initiate a Pause packet, the application must set this bit to 1. During Control packet transfer, this bit continues to be set to indicate that a packet transmission is in progress. When Pause packet transmission is complete, the MAC resets this bit to 0. You should not write to this register until this bit is cleared.

Half-duplex mode: When this bit is set (and TFE bit is set) in the Half-duplex mode, the MAC asserts the backpressure. During backpressure, when the MAC receives a new packet, the transmitter starts sending a JAM pattern resulting in a collision. When the MAC is configured for the Full-duplex mode, the BPA is automatically disabled.

Rx flow control register (ETH_MACRXFCR)

Address offset: 0x0090

Reset value: 0x0000 0000

The Receive Flow Control register controls the pausing of MAC Transmit based on the received Pause packet.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	UP	RFE
														rw	rw

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 UP: Unicast Pause Packet Detect

A pause packet is processed when it has the unique multicast address specified in the IEEE 802.3. When this bit is set, the MAC can also detect Pause packets with unicast address of the station. This unicast address should be as specified in [MAC Address 0 high register \(ETH_MACA0HR\)](#) and MAC Address 0 low register [MAC Address x low register \(ETH_MACAxLR\)](#).

When this bit is reset, the MAC only detects Pause packets with unique multicast address.

Note: The MAC does not process a Pause packet if the multicast address is different from the unique multicast address. This is also applicable to the received PFC packet when the Priority Flow Control (PFC) is enabled. The unique multicast address (0x01_80_C2_00_00_01) is as specified in IEEE 802.1 Qbb-2011.

Bit 0 RFE: Receive Flow Control Enable

When this bit is set and the MAC is operating in Full-duplex mode, the MAC decodes the received Pause packet and disables its transmitter for a specified (Pause) time. When this bit is reset or the MAC is operating in Half-duplex mode, the decode function of the Pause packet is disabled.

When PFC is enabled, flow control is enabled for PFC packets. The MAC decodes the received PFC packet and disables the Transmit queue, with matching priorities, for a duration of received Pause time.

Rx Queue control register (ETH_MACRXQCR)

Address offset: 0x0094

Reset value: 0x0000 0000

The Receive Queue Control register controls the routing of unicast and multicast packets that fail the Destination or Source address filter to the Rx queues

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	VFFQ	VFFQE

Res.	Res.	Res.	Res.	Res.	Res.	MFFQ	MFFQE	Res.	Res.	Res.	Res.	Res.	Res.	UFFQ	UFFQE
						rw	rw							rw	rw

Bits 31:18 Reserved, must be kept at reset value.

Bit 17 VFFQ: VLAN Tag Filter Fail Packets Queue

This field holds the Rx queue number to which the tagged packets failing the Destination or Source Address filter (and UFFQE/MFFQE not enabled) or failing the VLAN tag filter must be routed to. This field is valid only when the VFFQE bit is set.

- 0: Queue 0
- 1: Queue 1

Bit 16 VFFQE: VLAN Tag Filter Fail Packets Queuing Enable

When this bit is set, the tagged packets which fail the Destination or Source address filter or fail the VLAN tag filter are routed to the Rx Queue Number programmed in the VFFQ. When this bit is reset, the tagged packets which fail the Destination or Source Address filter or fail the VLAN tag filter are routed based on other routing options. This bit is valid only when the RA bit of the [Packet filtering control register \(ETH_MACPFR\)](#) is set.

- 0: Disabled
- 1: Enabled

Bits 15:10 Reserved, must be kept at reset value.

Bit 9 MFFQ: Multicast Address Filter Fail Packets Queue.

This field holds the Rx queue number to which the Multicast packets failing the Destination or Source Address filter are routed to. This field is valid only when the MFFQE bit is set.

- 0: Queue 0
- 1: Queue 1

Bit 8 MFFQE: Multicast Address Filter Fail Packets Queuing Enable.

When this bit is set, the Multicast packets which fail the Destination or Source address filter is routed to the Rx Queue Number programmed in the MFFQ.

When this bit is reset, the Multicast packets which fail the Destination or Source address filter is routed based on other routing options.

This bit is valid only when the RA bit of the [Packet filtering control register \(ETH_MACPFR\)](#) is set.

Bits 7:2 Reserved, must be kept at reset value.

Bit 1 **UFFQ**: Unicast Address Filter Fail Packets Queue.

This field holds the Rx queue number to which the Unicast packets failing the Destination or Source Address filter are routed to. This field is valid only when the UFFQE bit is set.

0: Queue 0

1: Queue 1

Bit 0 **UFFQE**: Unicast Address Filter Fail Packets Queuing Enable.

When this bit is set, the Unicast packets which fail the Destination or Source address filter is routed to the Rx Queue Number programmed in the UFFQ.

When this bit is reset, the Unicast packets which fail the Destination or Source Address filter is routed based on other routing options.

This bit is valid only when the RA bit of the [Packet filtering control register \(ETH_MACPFR\)](#) is set.

Rx queue control 0 register (ETH_MACRXQC0R)

Address offset: 0x00A0

Reset value: 0x0000 0000

The Receive Queue Control 0 register controls the queue management in the MAC Receiver.

Note: In multiple Rx queues configuration, all the queues are disabled by default. Enable the Rx queue by programming the corresponding field in this register.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

													rw	rw	rw	rw

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:2 **RXQ1EN[1:0]**: Receive Queue 1 Enable

This field indicates whether Rx queue 1 is enabled for AV or Generic traffic.

00: Not enabled

01: Queue 1 enabled for AV

10: Queue 1 enabled for Generic traffic

11: Reserved, must not be used

Bits 1:0 **RXQ0EN[1:0]**: Receive Queue 0 Enable

This field indicates whether Rx queue 0 is enabled for AV or Generic traffic.

00: Not enabled

01: Queue 0 enabled for AV

10: Queue 0 enabled for Generic traffic

11: Reserved, must not be used

Rx queue control 1 register (ETH_MACRXQC1R)

Address offset: 0x00A4

Reset value: 0x0000 0000

The Receive Queue Control 1 register controls the routing of multicast, broadcast, AV and untagged packets to the Rx queues.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.			TPQC[1:0]		TACPQE	MCBCQEN	Res.	MCBCQ[2:0]

	rw	rw	rw						rw	rw	rw		rw	rw	rw

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:22 **TPQC[1:0]**: Tagged PTP over Ethernet Packets Queuing Control

This field controls the routing of the VLAN tagged PTPoE packets.

00: VLAN tagged PTPoE packets are routed as generic VLAN tagged packet (based on PSRQ for only non-AV enabled Rx queues).

01: VLAN tagged PTPoE packets are routed to Rx Queue specified by PTPQ field (this Rx Queue can be enabled for AV or non-AV traffic)

10: VLAN tagged PTPoE packets are routed to only AV enabled Rx queues based on PSRQ.

11: Reserved

Bit 21 **TACPQE**: Tagged AV Control Packets Queuing Enable

When set, the MAC routes the received Tagged AV control packets to the Rx queue specified by AVCPQ field.

When reset, the MAC routes the received Tagged AV control packets based on the tag priority matching the PSRQ fields in ETH_MACRXQC2R register.

This field is reserved if Rx queues are not selected for AV feature.

Bit 20 **MCBCQEN**: Multicast and Broadcast Queue Enable

This bit specifies that Multicast or Broadcast packets routing to the Rx queue is enabled and the Multicast or Broadcast packets must be routed to Rx queue specified in MCBCQ field.

Bit 19 Reserved, must be kept at reset value.

Bits 18:16 **MCBCQ[2:0]**: Multicast and Broadcast Queue

This field specifies the Rx queue onto which Multicast or Broadcast packets are routed. Any Rx queue enabled for Generic/AV traffic can be used to route the Multicast or Broadcast packets.

000: Rx queue 0

001: Rx queue 1

Others: Reserved, must not be used

Bit 15 Reserved, must be kept at reset value.

Bits 14:12 **UPQ[2:0]**: Untagged Packet Queue

This field indicates the Rx queue to which Untagged Packets are to be routed. Any Rx queue enabled for Generic/AV traffic can be used to route the Untagged Packets.

000: Rx queue 0

001: Rx queue 1

Others: Reserved, must not be used

Bits 11:7 Reserved, must be kept at reset value.

Bits 6:4 **PTPQ[2:0]**: PTP Packets Queue

This field specifies the Rx queue on which the PTP packets sent over the Ethernet payload (not over IPv4 or IPv6) are routed.

000: Rx queue 0

001: Rx queue 1

Others: Reserved, must not be used

When the AV8021ASMEN bit of *Timestamp control Register (ETH_MACTSCR)* is set, only untagged PTP over Ethernet packets are routed on an Rx queue. If the bit is not set, then based on programming of TPQC field, both tagged and untagged PTPoE packets can be routed to this Rx Queue.

Bit 3 Reserved, must be kept at reset value.

Bits 2:0 **AVCPQ[2:0]**: AV Untagged Control Packets Queue

This field specifies the Receive queue on which the received AV untagged control packets are routed:

000: Receive Queue 0

001: Receive Queue 1

Others: Reserved, must not be used

The AV tagged control and data packets are routed based on PSRQ field in the Transmit Flow Control Register of corresponding queue.

This field is reserved if Receive queues are not selected for AV feature.

Rx queue control 2 register (ETH_MACRXQC2R)

Address offset: 0x00A8

Reset value: 0x0000 0000

This register controls the routing of tagged packets based on the USP (user priority) field of the received packets to the Rx queue 0 and 1.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:8 **PSRQ1[7:0]**: Priorities Selected in the Receive Queue 1

This field defines the priorities assigned to Rx queue 1. All packets with priorities that match the values set in this field are routed to Rx queue 1.

For example, if PSRQ1[4] is set, packets with USP field equal to 4 are routed to Rx queue 1. The software must ensure that the content of this field is mutually exclusive to the PSRQ fields for other queues, that is, the same priority is not mapped to multiple Rx queues.

Bits 7:0 **PSRQ0[7:0]**: Priorities Selected in the Receive Queue 0

This field defines the priorities assigned to Rx queue 0. All packets with priorities that match the values set in this field are routed to Rx queue 0.

For example, if PSRQ0[5] is set, packets with USP field equal to 5 are routed to Rx queue 0. The software must ensure that the content of this field is mutually exclusive to the PSRQ fields for other queues, that is, the same priority is not mapped to multiple Rx queues.

Interrupt status register (ETH_MACISR)

Address offset: 0x00B0

Reset value: 0x0000 0000

The Interrupt Status register contains the status of interrupts.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	RXSTIS	TXSTIS	TSIS	Res.	MMCTXIS	MMCRXIS	MMCIS	Res.	Res.	LPIIS	PMTIS	PHYSIS	Res.	Res.	RGSMIIS
	rc_r	rc_r	rc_r		r	r	r			r	r	r			r

Bits 31:15 Reserved, must be kept at reset value.

Bit 14 **RXSTIS**: Receive Status Interrupt

This bit indicates the status of received packets. This bit is set when the RWT bit is set in the *Rx Tx status register (ETH_MACRXTXSR)*. This bit is cleared when the corresponding interrupt source bit is read (or corresponding interrupt source bit is written to 1 when RCWE bit of *CSR software control register (ETH_MACCSRSWCR)* is set) in the ETH_MACISR register.

Bit 13 **TXSTIS**: Transmit Status Interrupt

This bit indicates the status of transmitted packets. This bit is set when any of the following bits is set in the *Rx Tx status register (ETH_MACRXTXSR)*:

- Excessive Collision (EXCOL)
- Late Collision (LCOL)
- Excessive Deferral (EXDEF)
- Loss of Carrier (LCARR)
- No Carrier (NCARR)
- Jabber Timeout (TJT)

This bit is cleared when the corresponding interrupt source bit is read (or corresponding interrupt source bit is written to 1 when RCWE bit of *CSR software control register (ETH_MACCSRSWCR)* is set) in the ETH_MACISR register.

Bit 12 TSIS: Timestamp Interrupt Status

If the Timestamp feature is enabled, this bit is set when any of the following conditions is true:

- The system time value is equal to or exceeds the value specified in the Target Time High and Low registers.
- There is an overflow in the Seconds register.
- The Target Time Error occurred, that is, programmed target time already elapsed.

If the Auxiliary Snapshot feature is enabled, this bit is set when the auxiliary snapshot trigger is asserted.

When drop transmit status is enabled in MTL, this bit is set when the captured transmit timestamp is updated in the *Tx timestamp status nanoseconds register (ETH_MACTXTSSNR)* and *Tx timestamp status seconds register (ETH_MACTXTSSSR)* registers.

When PTP offload feature is enabled, this bit is set when the captured transmit timestamp is updated in the *Tx timestamp status nanoseconds register (ETH_MACTXTSSNR)* and *Tx timestamp status seconds register (ETH_MACTXTSSSR)* registers, for PTO generated Delay Request and Pdelay request packets.

This bit is cleared when the corresponding interrupt source bit is read (or corresponding interrupt source bit is written to 1 when RCWE bit of *CSR software control register (ETH_MACCSR)* is set) in the *Timestamp status register (ETH_MACTSSR)*.

Bit 11 Reserved, must be kept at reset value.

Bit 10 MMCTXIS: MMC Transmit Interrupt Status

This bit is set high when an interrupt is generated in the *MMC Tx interrupt register (ETH_MMC_TX_INTERRUPT)*. This bit is cleared when all bits in this interrupt register are cleared.

Bit 9 MMCRXIS: MMC Receive Interrupt Status

This bit is set high when an interrupt is generated in the *MMC Rx interrupt register (ETH_MMC_RX_INTERRUPT)*. This bit is cleared when all bits in this interrupt register are cleared.

Bit 8 MMCIS: MMC Interrupt Status

This bit is set high when MMCTXIS or MMCRXIS is set high. This bit is cleared only when all these bits are low.

Bits 7:6 Reserved, must be kept at reset value.

Bit 5 LPIIS: LPI Interrupt Status

This bit is set for any LPI state entry or exit in the MAC Transmitter or Receiver. This bit is cleared when the TLPIEN bit of *LPI control and status register (ETH_MACLCSR)* is read.

Bit 4 PMTIS: PMT Interrupt Status

This bit is set when a Magic packet or Wake-on-LAN packet is received in the power-down mode (RWKPRCVD and MGKPRCVD bits in *ETH_MACPCSR* register). This bit is cleared when Bits[6:5] are cleared because of a Read operation to the *PMT control status register (ETH_MACPCSR)*.

Bit 3 **PHYIS**: PHY Interrupt

This bit is set when rising edge is detected on the ETH_PHY_INTN input. This bit is cleared when this register is read.

Bits 2:1 Reserved, must be kept at reset value.

Bit 0 **RGSMIIS**: RGMII Interrupt Status

This bit is set by any change in value of the Link Status of RGMII interface (LNKSTS bit in [PHYIF control status register \(ETH_MACPHYCSR\)](#) register). This bit is cleared when the ETH_MACPHYCSR register is read.

Interrupt enable register (ETH_MACIER)

Address offset: 0x00B4

Reset value: 0x0000 0000

The Interrupt Enable register contains the masks for generating the interrupts.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

	rw	rw	rw							rw	rw	rw			rw

Bits 31:15 Reserved, must be kept at reset value.

Bit 14 **RXSTSIE**: Receive Status Interrupt Enable

When this bit is set, it enables the assertion of the interrupt signal because of the setting of RXSTSIS bit in the *Interrupt status register (ETH_MACISR)*.

Bit 13 **TXSTSIE**: Transmit Status Interrupt Enable

When this bit is set, it enables the assertion of the interrupt signal because of the setting of TXSTSIS bit in the *Interrupt status register (ETH_MACISR)*.

Bit 12 **TSIE**: Timestamp Interrupt Enable

When this bit is set, it enables the assertion of the interrupt signal because of the setting of TSIS bit in *Interrupt status register (ETH_MACISR)*.

Bits 11:6 Reserved, must be kept at reset value.

Bit 5 **LPIE**: LPI Interrupt Enable

When this bit is set, it enables the assertion of the interrupt signal because of the setting of LPIIS bit in *Interrupt status register (ETH_MACISR)*.

Bit 4 **PMTIE**: PMT Interrupt Enable

When this bit is set, it enables the assertion of the interrupt signal because of the setting of PMTIS bit in *Interrupt status register (ETH_MACISR)*.

Bit 3 **PHYIE**: PHY Interrupt Enable

When this bit is set, it enables the assertion of the interrupt signal because of the setting of PHYIS bit in *Interrupt status register (ETH_MACISR)*.

Bits 2:1 Reserved, must be kept at reset value.

Bit 0 **RGSMIIIE**: RGMII Interrupt Enable

When this bit is set, it enables the assertion of the interrupt signal because of the setting of RGSMIIIS bit in *Interrupt status register (ETH_MACISR)*.

Rx Tx status register (ETH_MACRXTXSR)

Address offset: 0x00B8

Reset value: 0x0000 0000

The Receive Transmit Status register contains the Receive and Transmit Error status.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	RWT	Res.	Res.	EXCOL	LCOL	EXDEF	LCARR	NCARR	TJT
							rc_r			rc_r	rc_r	rc_r	rc_r	rc_r	rc_r

Bits 31:9 Reserved, must be kept at reset value.

Bit 8 **RWT**: Receive Watchdog Timeout

This bit is set when a packet with length greater than 2,048 bytes is received (10, 240 bytes when Jumbo Packet mode is enabled) and the WD bit is reset in the *Operating mode configuration register (ETH_MACCCR)*. This bit is set when a packet with length greater than 16,383 bytes is received and the WD bit is set in the *Operating mode configuration register (ETH_MACCCR)*.

Cleared on read (or write of 1 when RCWE bit in *CSR software control register (ETH_MACCSRWCR)* is set).

Bits 7:6 Reserved, must be kept at reset value.

Bit 5 **EXCOL**: Excessive Collisions

When the DTXSTS bit is set in the *Operating mode Register (ETH_MTLOMR)*, this bit indicates that the transmission aborted after 16 successive collisions while attempting to transmit the current packet. If the DR bit is set in the *Operating mode configuration register (ETH_MACCCR)*, this bit is set after the first collision and the packet transmission is aborted. Cleared on read (or write of 1 when RCWE bit in *CSR software control register (ETH_MACCSRWCR)* is set).

Bit 4 **LCOL**: Late Collision

When the DTXSTS bit is set in the *Operating mode Register (ETH_MTLOMR)*, this bit indicates that the packet transmission aborted because a collision occurred after the collision window (64 bytes including Preamble in MII mode; 512 bytes including Preamble and Carrier Extension in GMII mode).

This bit is not valid if the Underflow error occurs.

Cleared on read (or write of 1 when RCWE bit in *CSR software control register (ETH_MACCSRWCR)* is set).

Bit 3 **EXDEF**: Excessive Deferral

When the DTXSTS bit is set in the *Operating mode Register (ETH_MTLOMR)* and the DC bit is set in the *Operating mode configuration register (ETH_MACCCR)*, this bit indicates that the transmission ended because of excessive deferral of over 24,288 bit times (155,680 in 1000 Mbps mode or when Jumbo packet is enabled).

Cleared on read (or write of 1 when RCWE bit in *CSR software control register (ETH_MACCSRWCR)* is set).

Bit 2 **LCARR**: Loss of Carrier

When the DTXSTS bit is set in the *Operating mode Register (ETH_MTL0MR)*, this bit indicates that the loss of carrier occurred during packet transmission, that is, the ETH_CRS signal was inactive for one or more transmission clock periods during packet transmission. This bit is valid only for packets transmitted without collision.

Cleared on read (or write of 1 when RCWE bit in *CSR software control register (ETH_MACCSRWCR)* is set).

Bit 1 **NCARR**: No Carrier

When the DTXSTS bit is set in the *Operating mode Register (ETH_MTL0MR)*, this bit indicates that the carrier signal from the PHY is not present at the end of preamble transmission.

Cleared on read (or write of 1 when RCWE bit in *CSR software control register (ETH_MACCSRWCR)* is set).

Bit 0 **TJT**: Transmit Jabber Timeout

This bit indicates that the Transmit Jabber Timer expired which happens when the packet size exceeds 2,048 bytes (10,240 bytes when the Jumbo packet is enabled) and JD bit is reset in the *Operating mode configuration register (ETH_MACCR)*. This bit is set when the packet size exceeds 16,383 bytes and the JD bit is set in the *Operating mode configuration register (ETH_MACCR)*.

Cleared on read (or write of 1 when RCWE bit in *CSR software control register (ETH_MACCSRWCR)* is set).

PMT control status register (ETH_MACPCSR)

Address offset: 0x00C0

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
RWKFILTRST	Res.	Res.	RWKPTR[4:0]				Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
rw			r	r	r	r	r								
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	RWKPF	GLBLUCAST	Res.	Res.	RWKPRCVD	MGKPRCVD	Res.	Res.	RWKPKTEN	MGKPKTEN	PWRDWN
					rw	rw			r	rc_r			rw	rw	rw

Bit 31 **RWKFILTRST**: Remote wakeup Packet Filter Register Pointer Reset

When this bit is set, the remote wakeup packet filter register pointer is reset to 0. It is automatically cleared after 1 clock cycle.

Bits 30:29 Reserved, must be kept at reset value.

Bits 28:24 **RWKPTR[4:0]**: Remote wakeup FIFO Pointer

This field gives the current value (0 to 7) of the Remote wakeup Packet Filter register pointer. When the value of this pointer is equal to 7, the contents of the Remote wakeup Packet Filter Register are transferred to the eth_mii_rx_clk domain when a Write occurs to that register.

Bits 23:11 Reserved, must be kept at reset value.

Bit 10 RWKPFPE: Remote wakeup Packet Forwarding Enable

When this bit is set along with RWKPKTEN, the MAC receiver drops all received frames until it receives the expected wakeup frame. All frames after that event including the received wakeup frame are forwarded to application. This bit is then self-cleared on receiving the wakeup packet.

The application can also clear this bit before the expected wakeup frame is received. In such cases, the MAC reverts to the default behavior where packets received are forwarded to the application. This bit must only be set when RWKPKTEN is set high and PWRDWN is set low. The setting of this bit has no effect when PWRDWN is set high.

Note: If Magic Packet Enable and wakeup Frame Enable are both set along with setting of this bit and Magic Packet is received prior to wakeup frame, this bit is self-cleared on receiving Magic Packet, the received Magic packet is dropped, and all frames after received Magic Packet are forwarded to application.

Bit 9 GLBLUCAST: Global Unicast

When this bit set, any unicast packet filtered by the MAC (DAF) address recognition is detected as a remote wakeup packet.

Bits 8:7 Reserved, must be kept at reset value.

Bit 6 RWKPRCVD: Remote wakeup Packet Received

When this bit is set, it indicates that the power management event is generated because of the reception of a remote wakeup packet. This bit is cleared when this register is read.

Bit 5 MGKPRCVD: Magic Packet Received

When this bit is set, it indicates that the power management event is generated because of the reception of a magic packet. This bit is cleared when this register is read (or write of 1 when RCWE bit in *CSR software control register (ETH_MACCSRSWGR)* is set).

Bits 4:3 Reserved, must be kept at reset value.

Bit 2 RWKPKTEN: Remote wakeup Packet Enable

When this bit is set, a power management event is generated when the MAC receives a remote wakeup packet.

Bit 1 MGKPKTEN: Magic Packet Enable

When this bit is set, a power management event is generated when the MAC receives a magic packet.

Bit 0 PWRDWN: Power Down

When this bit is set, the MAC receiver drops all received packets until it receives the expected magic packet or remote wakeup packet. This bit is then self-cleared and the power-down mode is disabled. The software can clear this bit before the expected magic packet or remote wakeup packet is received. The packets received by the MAC after this bit is cleared are forwarded to the application. This bit must only be set when the Magic Packet Enable, Global Unicast, or Remote wakeup Packet Enable bit is set high.

Note: You can gate-off the CSR clock during the power-down mode. However, when the CSR clock is gated-off, you cannot perform any read or write operations on this register. Therefore, the Software cannot clear this bit.

Remote wakeup packet filter register (ETH_MACRWKPFRR)

Address offset: 0x00C4

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
MACRWKPFRR[31:16]

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MACRWKPFRR[15:0]															
rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW

Bits 31:0 **MACRWKPFRR[31:0]**: Remote wakeup packet filter

Refer to [Table 525](#), [Table 526](#) and [Table 527](#) for details on register content and programming sequence.

The ETH_MACRWKPFRR register at address 0x00C4 loads the wakeup Packet Filter register.

To load values in a wakeup Packet Filter register, the entire register (ETH_MACRWKPFRR) must be written. The ETH_MACRWKPFRR register is loaded by sequentially loading the eight, sixteen or thirty two register values in address (0x00C4) for ETH_MACRWKPFRR value 0 to 7, respectively. The ETH_MACRWKPFRR register is read in a similar way. The Ethernet peripheral updates the ETH_MACRWKPFRR register current pointer value in Bits[26:24] of ETH_MACPCSR register.

LPI control and status register (ETH_MACLCSR)

Address offset: 0x00D0

Reset value: 0x0000 0000

The LPI Control and Status Register controls the LPI functions and provides the LPI interrupt status. The status bits are cleared when this register is read.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	LPITCSE	LPITE	LPITXA	PLSEN	PLS	LPIEN
										rW	rW	rW	rW	rW	rW
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	RLPIST	TLPIST	Res.	Res.	Res.	Res.	RLPIEX	RLPIEN	TLPIEX	TLPIEN
						r	r					r	r	r	r

Bits 31:22 Reserved, must be kept at reset value.

Bit 21 **LPITCSE**: LPI Tx Clock Stop Enable

When this bit is set, the MAC asserts `sbd_tx_clk_gating_ctrl_o` signal high after it enters Tx LPI mode to indicate that the Tx clock to MAC can be stopped. When this bit is reset, the MAC does not assert `sbd_tx_clk_gating_ctrl_o` signal high after it enters Tx LPI mode. If RGMII Interface is selected, the Tx clock is required for transmitting the LPI pattern. The Tx Clock cannot be gated and so the LPITCSE bit cannot be programmed.

Bit 20 **LPITE**: LPI Timer Enable

This bit controls the automatic entry of the MAC Transmitter into and exit out of the LPI state. When LPITE, LPITXA and LPIEN bits are set, the MAC Transmitter enters LPI state only when the complete MAC TX data path is IDLE for a period indicated by the `ETH_MACLETR` register.

After entering LPI state, if the data path becomes non-IDLE (due to a new packet being accepted for transmission), the Transmitter exits LPI state but does not clear LPIEN bit. This enables the re-entry into LPI state when it is IDLE again.

When LPITE is 0, the LPI Auto timer is disabled and MAC Transmitter enters LPI state based on the settings of LPITXA and LPIEN bit descriptions.

Bit 19 **LPITXA**: LPI Tx Automate

This bit controls the behavior of the MAC when it is entering or coming out of the LPI mode on the Transmit side.

If the LPITXA and LPIEN bits are set to 1, the MAC enters the LPI mode only after all outstanding packets (in the core) and pending packets (in the application interface) have been transmitted. The MAC comes out of the LPI mode when the application sends any packet for transmission or the application issues a Tx FIFO Flush command. In addition, the MAC automatically clears the LPIEN bit when it exits the LPI state. If Tx FIFO Flush is set in the FTQ bit of `ETH_MTLTxQiOMR`, when the MAC is in the LPI mode, it exits the LPI mode. When this bit is 0, the LPIEN bit directly controls behavior of the MAC when it is entering or coming out of the LPI mode.

Bit 18 **PLSEN**: PHY Link Status Enable

This bit enables the link status received on the RGMII Receive paths to be used for activating the LPI LS TIMER.

When this bit is set, the MAC uses the link-status bits of the `ETH_MACPHYCSR` register and the PLS bit for the LPI LS Timer trigger. When this bit is reset, the MAC ignores the link-status bits of the `ETH_MACPHYCSR` register and takes only the PLS bit.

Bit 17 **PLS**: PHY Link Status

This bit indicates the link status of the PHY. The MAC Transmitter asserts the LPI pattern only when the link status is up (OKAY) at least for the time indicated by the LPI LS TIMER.

When this bit is set, the link is considered to be okay (UP) and when this bit is reset, the link is considered to be down.

Bit 16 **LPIEN**: LPI Enable

When this bit is set, it instructs the MAC Transmitter to enter the LPI state. When this bit is reset, it instructs the MAC to exit the LPI state and resume normal transmission.

This bit is cleared when the LPITXA bit is set and the MAC exits the LPI state because of the arrival of a new packet for transmission.

Bits 15:10 Reserved, must be kept at reset value.

Bit 9 **RLPIST**: Receive LPI State

When this bit is set, it indicates that the MAC is receiving the LPI pattern on the GMII or MII interface.

Bit 8 **TLPIST**: Transmit LPI State

When this bit is set, it indicates that the MAC is transmitting the LPI pattern on the GMII or MII interface.

Bits 7:4 Reserved, must be kept at reset value.

Bit 3 **RLPIEX**: Receive LPI Exit

When this bit is set, it indicates that the MAC Receiver has stopped receiving the LPI pattern on the GMII or MII interface, exited the LPI state, and resumed the normal reception. This bit is cleared by a read into this register (or write of 1 when RCWE bit in *CSR software control register (ETH_MACCSRSWCR)* is set).

Note: This bit may not be set if the MAC stops receiving the LPI pattern for a very short duration, such as, less than three clock cycles of CSR clock.

Bit 2 **RLPIEN**: Receive LPI Entry

When this bit is set, it indicates that the MAC Receiver has received an LPI pattern and entered the LPI state. This bit is cleared by a read into this register (or write of 1 when RCWE bit in *CSR software control register (ETH_MACCSRSWCR)* is set).

Note: This bit may not be set if the MAC stops receiving the LPI pattern for a very short duration, such as, less than three clock cycles of CSR clock.

Bit 1 **TLPIEX**: Transmit LPI Exit

When this bit is set, it indicates that the MAC transmitter exited the LPI state after the application cleared the LPIEN bit and the LPI TW Timer has expired. This bit is cleared by a read into this register (or write of 1 when RCWE bit in *CSR software control register (ETH_MACCSRSWCR)* is set).

Bit 0 **TLPIEN**: Transmit LPI Entry

When this bit is set, it indicates that the MAC Transmitter has entered the LPI state because of the setting of the LPIEN bit. This bit is cleared by a read into this register (or write of 1 when RCWE bit in *CSR software control register (ETH_MACCSRSWCR)* is set).

LPI timers control register (ETH_MACLTCR)

Address offset: 0x00D4

Reset value: 0x03E8 0000

The LPI Timers Control register controls the timeout values in the LPI states. It specifies the time for which the MAC transmits the LPI pattern and also the time for which the MAC waits before resuming the normal transmission.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w

Bits 31:26 Reserved, must be kept at reset value.

Bits 25:16 **LST[9:0]**: LPI LS Timer

This field specifies the minimum time (in milliseconds) for which the link status from the PHY should be up (OKAY) before the LPI pattern can be transmitted to the PHY. The MAC does not transmit the LPI pattern even when the LPIEN bit is set unless the LPI LS Timer reaches the programmed terminal count. The default value of the LPI LS Timer is 1000 (1 sec) as defined in the IEEE standard.

Bits 15:0 **TWT[15:0]**: LPI TW Timer

This field specifies the minimum time (in microseconds) for which the MAC waits after it stops transmitting the LPI pattern to the PHY and before it resumes the normal transmission. The TLPIEX status bit is set after the expiry of this timer.

LPI entry timer register (ETH_MACLETR)

Address offset: 0x00D8

Reset value: 0x0000 0000

This register controls the Tx LPI entry timer. This counter is enabled only when LPITE bit of [LPI control and status register \(ETH_MACLCSR\)](#) register is set to 1.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:0 **LPIET[19:0]**: LPI Entry Timer

This field specifies the time in microseconds the MAC waits to enter LPI mode, after it has transmitted all the frames. This field is valid and used only when LPITE and LPITXA are set to 1.

Bits [2:0] are read-only so that the granularity of this timer is in steps of 8 micro-seconds.

One-microsecond-tick counter register (ETH_MAC1USTCR)

Address offset: 0x00DC

Reset value: 0x0000 0000

This register controls the generation of the Reference time (one-microsecond tick) for all the LPI timers. This timer has to be programmed by the software initially.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

				r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w

Bits 31:12 Reserved, must be kept at reset value.

Bits 11:0 TIC_1US_CNTR[11:0]: 1 µs tick Counter

The application must program this counter so that the number of clock cycles of CSR clock is 1 µs (subtract 1 from the value before programming).

For example if the CSR clock is 100 MHz then this field needs to be programmed to 100 - 1 = 99 (which is 0x63).

This is required to generate the 1 µs events that are used to update some of the EEE related counters.

PHYIF control status register (ETH_MACPHYCSR)

Address offset: 0x00F8

Reset value: 0x0000 0000

The PHY Interface Control and Status register indicates the status signals received by the RGMII interface from the PHY.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

														rw	rw

Bits 31:20 Reserved, must be kept at reset value.

Bit 19 **LNKSTS**: Link Status

This bit indicates whether the link is up or down.

0: Link down

1: Link up

Bits 18:17 **LNKSPEED[1:0]**: Link Speed

This bit indicates the current speed of the link:

00: 2.5 MHz

01: 25 MHz

10: 125 MHz

11: Reserved, must not be used

Bit 16 **LNKMOD**: Link Mode

This bit indicates the current operating mode of the link:

0: Half-duplex mode

1: Full-duplex mode

Bits 15:2 Reserved, must be kept at reset value.

Bit 1 **LUD**: Link Up or Down

This bit indicates whether the link is up or down during transmission of configuration in the RGMII interface.

0: Link Down

1: Link Up

Bit 0 **TC**: Transmit Configuration in RGMII

When set, this bit enables the transmission of duplex mode, link speed, and link up or down information to the PHY in the RGMII port. When this bit is reset, no such information is driven to the PHY (see [Section 64.6.4: Reduced media independent interface \(RMII\)](#)).

Version register (ETH_MACVR)

Address offset: 0x0110

Reset value: 0x0000 4042

The version register identifies the version of the Ethernet peripheral.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res	Res	Res	Res	Res	Res	Res	Res	Res	Res	Res	Res	Res	Res	Res	Res

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:8 **USERVER[7:0]**: ST-defined version

Bits 7:0 **SNPSVER[7:0]**: IP version

Debug register (ETH_MACDR)

Address offset: 0x0114

Reset value: 0x0000 0000

The Debug register provides the debug status of various MAC blocks.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TFCSTS[1:0]		TPESTS

Bits 31:19 Reserved, must be kept at reset value.

Bits 18:17 **TFCSTS[1:0]**: MAC Transmit Packet Controller Status

This field indicates the state of the MAC Transmit Packet Controller module:

00: Idle state

01: Waiting for one of the following:

- Status of the previous packet
- IPG or backoff period to be over

10: Generating and transmitting a Pause control packet (in Full-duplex mode)

11: Transferring input packet for transmission

Bit 16 **TPESTS**: MAC GMII or MII Transmit Protocol Engine Status

When this bit is set, it indicates that the MAC GMII or MII transmit protocol engine is actively transmitting data, and it is not in the Idle state.

Bits 15:3 Reserved, must be kept at reset value.

Bits 2:1 **RFCFCSTS[1:0]**: MAC Receive Packet Controller FIFO Status

When this bit is set, this field indicates the active state of the small FIFO Read and Write controllers of the MAC Receive Packet Controller module.

Bit 0 **RPESTS**: MAC GMII or MII Receive Protocol Engine Status

When this bit is set, it indicates that the MAC GMII or MII receive protocol engine is actively receiving data, and it is not in the Idle state.

HW feature 0 register (ETH_MACHWF0R)

Address offset: 0x011C

Reset value: 0x0A0D 73F5

This register indicates the presence of first set of the optional features or functions of the Ethernet peripheral. The software driver can use this register to dynamically enable or disable the programs related to the optional blocks.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

- Bit 31 Reserved, must be kept at reset value.
- Bits 30:28 **ACTPHYSEL[2:0]**: Active PHY Selected
When you have multiple PHY interfaces in your configuration, this field indicates the sampled value of `phy_intf_sel_i` during reset de-assertion:
000: GMII or MII
001: RGMII
010: SGMII
011: TBI
100: RMII
101: RTBI
110: SMII
Others: Reserved, must not be used
- Bit 27 **SAVLANINS**: Source Address or VLAN Insertion Enable
This bit is set to 1 when the Enable SA and VLAN Insertion on Tx option is selected
- Bits 26:25 **TSSTSEL[1:0]**: Timestamp System Time Source
This bit indicates the source of the Timestamp system time:
01: Internal
10: External
11: Both
00: Reserved, must not be used
This bit is set to 1 when the Enable IEEE 1588 Timestamp Support option is selected
- Bit 24 **MACADR64SEL**: MAC Addresses 64-127 Selected
This bit is set to 1 when the Enable Additional 64 MAC Address Registers (64-127) option is selected
- Bit 23 **MACADR32SEL**: MAC Addresses 32-63 Selected
This bit is set to 1 when the Enable Additional 32 MAC Address Registers (32-63) option is selected
- Bits 22:18 **ADDMACADRSEL[4:0]**: MAC Addresses 1-31 Selected
This bit is set to 1 when the Enable Additional 1-31 MAC Address Registers option is selected
- Bit 17 Reserved, must be kept at reset value.
- Bit 16 **RXCOESEL**: Receive Checksum Offload Enabled
This bit is set to 1 when the Enable Receive TCP/IP Checksum Check option is selected
- Bit 15 Reserved, must be kept at reset value.
- Bit 14 **TXCOESEL**: Transmit Checksum Offload Enabled
This bit is set to 1 when the Enable Transmit TCP/IP Checksum Insertion option is selected
- Bit 13 **EEESEL**: Energy Efficient Ethernet Enabled
This bit is set to 1 when the Enable Energy Efficient Ethernet (EEE) option is selected
- Bit 12 **TSEL**: IEEE 1588-2008 Timestamp Enabled
This bit is set to 1 when the Enable IEEE 1588 Timestamp Support option is selected
- Bits 11:10 Reserved, must be kept at reset value.
- Bit 9 **ARPOFFSEL**: ARP Offload Enabled
This bit is set to 1 when the Enable IPv4 ARP Offload option is selected
- Bit 8 **MMCSEL**: RMON Module Enable
This bit is set to 1 when the Enable MAC management counters (MMC) option is selected

- Bit 7 **MGKSEL**: PMT Magic Packet Enable
This bit is set to 1 when the Enable Magic Packet Detection option is selected
- Bit 6 **RWKSEL**: PMT Remote Wakeup Packet Enable
This bit is set to 1 when the Enable Remote wakeup Packet Detection option is selected
- Bit 5 **SMASEL**: SMA (MDIO) Interface
This bit is set to 1 when the Enable Station Management (MDIO Interface) option is selected
- Bit 4 **VLHASH**: VLAN Hash Filter Selected
This bit is set to 1 when the Enable VLAN Hash Table Based Filtering option is selected
- Bit 3 **PCSSEL**: PCS Registers (TBI, SGMII, or RTBI PHY interface)
This bit is set to 1 when the TBI, SGMII, or RTBI PHY interface option is selected
- Bit 2 **HDSEL**: Half-duplex Support
This bit is set to 1 when the Half-duplex mode is selected
- Bit 1 **GMISEL**: 1000 Mbps Support
This bit is set to 1 when 1000 Mbps is selected as operating mode.
- Bit 0 **MIISEL**: 10 or 100 Mbps Support
This bit is set to 1 when 10/100 Mbps is selected as operating mode.

HW feature 1 register (ETH_MACHWF1R)

Address offset: 0x0120

Reset value: 0x1114 1945

This register indicates the presence of second set of the optional features or functions of the Ethernet peripheral. The software driver can use this register to dynamically enable or disable the programs related to the optional blocks.

This field indicates the size of the Hash table:
00: No Hash table
01: 64
10: 128
11: 256
- Bit 23 **POUOST**: One Step for PTP over UDP/IP Feature Enable
This bit is set to 1 when the Enable one step timestamp for PTP over UDP/IP feature is selected.
- Bit 22 Reserved, must be kept at reset value.
- Bit 21 **RAVSEL**: Rx Side Only AV Feature Enable
This bit is set to 1 when the Enable Audio video bridging option on Rx Side Only is selected.
- Bit 20 **AVSEL**: AV Feature Enable
This bit is set to 1 when the Enable Audio video bridging option is selected.
- Bit 19 **DBGMEMA**: DMA Debug Registers Enable
This bit is set to 1 when the Debug Mode Enable option is selected
- Bit 18 **TSOEN**: TCP Segmentation Offload Enable
This bit is set to 1 when the Enable TCP Segmentation Offloading for TCP/IP Packets option is selected
- Bit 17 **SPHEN**: Split Header Feature Enable
This bit is set to 1 when the Enable Split Header Structure option is selected
- Bit 16 **DCBEN**: DCB Feature Enable
This bit is set to 1 when the Enable Data Center Bridging option is selected
- Bits 15:14 **ADDR64[1:0]**: Address width
This field indicates the configured address width.
00: 32 bits
Others: Reserved, must not be used
- Bit 13 **ADVTHWORD**: IEEE 1588 High Word Register Enable
This bit is set to 1 when the Add IEEE 1588 Higher Word Register option is selected
- Bit 12 **PTOEN**: PTP Offload Enable
This bit is set to 1 when the Enable PTP Timestamp Offload Feature is selected.
- Bit 11 **OSTEN**: One-Step Timestamping Enable
This bit is set to 1 when the Enable One-Step Timestamp Feature is selected.

Bits 10:6 **TXFIFOSIZE[4:0]**: MTL Transmit FIFO Size

This field contains the configured value of MTL Tx FIFO in bytes expressed as Log to base 2 minus 7, that is, $\text{Log}_2(\text{TXFIFO_SIZE}) - 7$:

00000: 128 bytes
00001: 256 bytes
00010: 512 bytes
00011: 1,024 bytes
00100: 2,048 bytes
00101: 4,096 bytes
00110: 8,192 bytes
00111: 16,384 bytes
01000: 32 Kbytes
01001: 64 Kbytes
01010: 128 Kbytes
01011 to 11111: Reserved, must not be used

Bit 5 Reserved, must be kept at reset value.

Bits 4:0 **RXFIFOSIZE[4:0]**: MTL Receive FIFO Size

This field contains the configured value of MTL Rx FIFO in bytes expressed as Log to base 2 minus 7, that is, $\text{Log}_2(\text{RXFIFO_SIZE}) - 7$:

00000: 128 bytes
00001: 256 bytes
00010: 512 bytes
00011: 1,024 bytes
00100: 2,048 bytes
00101: 4,096 bytes
00110: 8,192 bytes
00111: 16,384 bytes
01000: 32 Kbytes
01001: 64 Kbytes
01010: 128 Kbytes
01011: 256 Kbytes
01100 to 11111: Reserved, must not be used

HW feature 2 register (ETH_MACHWF2R)

Address offset: 0x0124

Reset value: 0x4104 0041

This register indicates the presence of third set of the optional features or functions of the Ethernet peripheral. The software driver can use this register to dynamically enable or disable the programs related to the optional blocks.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit 31 Reserved, must be kept at reset value.

Bits 30:28 **AUXSNAPNUM[2:0]**: Number of Auxiliary Snapshot Inputs
 This field indicates the number of auxiliary snapshot inputs:
 000: No auxiliary input
 001: 1 auxiliary input
 010: 2 auxiliary inputs
 011: 3 auxiliary inputs
 100: 4 auxiliary inputs
 101 to 111: Reserved, must not be used

Bit 27 Reserved, must be kept at reset value.

Bits 26:24 **PPSOUTNUM[2:0]**: Number of PPS Outputs
 This field indicates the number of PPS outputs:
 000: No PPS output
 001: 1 PPS output
 010: 2 PPS outputs
 011: 3 PPS outputs
 100: 4 PPS outputs
 101 to 111: Reserved, must not be used

Bits 23:22 **TDCSZ[1:0]**: Tx DMA Descriptor Cache Size in terms of 16-byte descriptors
 00: Cache not configured
 01: Four 16-byte descriptors
 10: Eight 16-byte descriptors
 11: Sixteen 16-byte descriptors

Bits 21:18 **TXCHCNT[3:0]**: Number of DMA Transmit Channels
 This field indicates the number of DMA Transmit channels:
 0000: 1 DMA Tx Channel
 0001: 2 DMA Tx Channels
 ..
 0111: 8 DMA Tx

Bits 17:16 **RDCSZ[1:0]**: Rx DMA Descriptor Cache Size in terms of 16-byte descriptors

- 00: Cache not configured
- 01: Four 16-byte descriptors
- 10: Eight 16-byte descriptors
- 11: Sixteen 16-byte descriptors

Bits 15:12 **RXCHCNT[3:0]**: Number of DMA Receive Channels

This field indicates the number of DMA Receive channels:

- 0000: 1 DMA Rx Channel
- 0001: 2 DMA Rx Channels
- ..
- 0111: 8 DMA Rx

Bits 11:10 Reserved, must be kept at reset value.

Bits 9:6 **TXQCNT[3:0]**: Number of MTL Transmit Queues

This field indicates the number of MTL Transmit queues:

- 0000: 1 MTL Tx queue
- 0001: 2 MTL Tx queues
- ..
- 0111: 8 MTL Tx

Bits 5:4 Reserved, must be kept at reset value.

Bits 3:0 **RXQCNT[3:0]**: Number of MTL Receive Queues

This field indicates the number of MTL Receive queues:

- 0000: 1 MTL Rx queue
- 0001: 2 MTL Rx queues
- ..
- 0111: 8 MTL Rx

HW feature 3 register (ETH_MACHWF3R)

Address offset: 0x0128

Reset value: 0x0000 0020

This register indicates the presence of fourth set the optional features or functions of the Ethernet peripheral. The software driver can use this register to dynamically enable or disable the programs related to the optional blocks.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DVLAN	CBTISEL	Res.	NRVF[2:0]		
										r	r		r	r	r

Bits 31:6 Reserved, must be kept at reset value.

Bit 5 **DVLAN**: Double VLAN processing enable
 This bit is set to 1 when Double VLAN processing is enabled.

Bit 4 **CBTISEL**: Queue/Channel based VLAN tag insertion on Tx enable
 This bit is set to 1 when the Enable Queue/Channel based VLAN tag insertion on Tx feature is selected.

Bit 3 Reserved, must be kept at reset value.

Bits 2:0 **NRVF[2:0]**: Number of Extended VLAN Tag Filters Enabled
 This field indicates the Number of Extended VLAN Tag Filters selected:
 000: No Extended Rx VLAN Filters
 001: 4 Extended Rx VLAN Filters
 010: 8 Extended Rx VLAN Filters
 011: 16 Extended Rx VLAN Filters
 100: 24 Extended Rx VLAN Filters
 101: 32 Extended Rx VLAN Filters
 110 to 111: Reserved, must not be used

MDIO address register (ETH_MACMDIOAR)

Address offset: 0x0200

Reset value: 0x0000 0000

The MDIO Address register controls the management cycles to external PHY through a management interface.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	PSE	BTB	PA[4:0]				RDA[4:0]					
				rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	NTC[2:0]			CR[3:0]				Res.	Res.	Res.	SKAP	GOC[1:0]		C45E	GB
	rw	rw	rw	rw	rw	rw	rw				rw	rw	rw	rw	rw

Bits 31:28 Reserved, must be kept at reset value.

Bit 27 **PSE**: Preamble Suppression Enable

When this bit is set, the SMA suppresses the 32-bit preamble and transmit MDIO frames with only 1 preamble bit.

When this bit is 0, the MDIO frame always has 32 bits of preamble as defined in the IEEE specifications.

Bit 26 **BTB**: Back to Back transactions

When this bit is set and the NTC has value greater than 0, then the MAC informs the completion of a read or write command at the end of frame transfer (before the trailing clocks are transmitted). The software can thus initiate the next command which is executed immediately irrespective of the number trailing clocks generated for the previous frame.

When this bit is reset, then the read/write command completion (GMII busy is cleared) only after the trailing clocks are generated. In this mode, it is ensured that the NTC is always generated after each frame.

This bit must not be set when NTC=0.

Bits 25:21 **PA[4:0]**: Physical Layer Address

This field indicates which Clause 22 PHY devices (out of 32 devices) the MAC is accessing. This field indicates which Clause 45 capable PHYs (out of 32 PHYs) the MAC is accessing.

Bits 20:16 **RDA[4:0]**: Register/Device Address

These bits select the PHY register in selected Clause 22 PHY device. These bits select the Device (MMD) in selected Clause 45 capable PHY.

Bit 15 Reserved, must be kept at reset value.

Bits 14:12 **NTC[2:0]**: Number of Training Clocks

This field controls the number of trailing clock cycles generated on ETH_MDC after the end of transmission of MDIO frame. The valid values can be from 0 to 7. Programming the value to 011 indicates that there are additional three clock cycles on the MDC line after the end of MDIO frame transfer.

Bits 11:8 **CR[3:0]**: CSR Clock Range

The CSR Clock Range selection determines the frequency of the MDC clock according to the CSR clock frequency used in your design:

0000: CSR clock = 60-100 MHz; MDC clock = CSR clock/42

0001: CSR clock = 100-150 MHz; MDC clock = CSR clock/62

0010: CSR clock = 20-35 MHz; MDC clock = CSR clock/16

0011: CSR clock = 35-60 MHz; MDC clock = CSR clock/26

0100: CSR clock = 150-250 MHz; MDC clock = CSR clock/102

0101: CSR clock = 250-300 MHz; MDC clock = CSR clock/124

0110 to 0111: Reserved, must not be used

The suggested range of CSR clock frequency applicable for each value (when Bit 11 = 0) ensures that the MDC clock is approximately between 1.0 MHz to 2.5 MHz frequency range.

When Bit 11 is set, you can achieve a higher frequency of the MDC clock than the frequency limit of 2.5 MHz (specified in the IEEE 802.3) and program a clock divider of lower value. For example, when CSR clock is of 100 MHz frequency and you program these bits to 1010, the resultant MDC clock is of 12.5 MHz which is above the range specified in IEEE 802.3.

Program the following values only if the interfacing chips support faster MDC clocks:

1000: CSR clock/4

1001: CSR clock/6

1010: CSR clock/8

1011: CSR clock/10

1100: CSR clock/12

1101: CSR clock/14

1110: CSR clock/16

1111: CSR clock/18

Bits 7:5 Reserved, must be kept at reset value.

Bit 4 **SKAP**: Skip Address Packet

When this bit is set, the SMA does not send the address packets before read, write, or post-read increment address packets. This bit is valid only when C45E is set.

Bits 3:2 **GOC[1:0]**: GMII Operation Command

This bit indicates the operation command to the PHY.

00: Reserved, must not be used

01: Write

10: Post Read Increment Address for Clause 45 PHY

11: Read

When Clause 22 PHY is enabled, only Write and Read commands are valid.

Bit 1 **C45E**: Clause 45 PHY Enable

When this bit is set, Clause 45 capable PHY is connected to MDIO. When this bit is reset, Clause 22 capable PHY is connected to MDIO.

Bit 0 **GB**: GMII Busy

The application sets this bit to instruct the SMA to initiate a Read or Write access to the MDIOS. The MAC clears this bit after the MDIO frame transfer is completed. Hence the software must not write or change any of the fields in *MDIO address register (ETH_MACMDIOAR)* and *MDIO data register (ETH_MACMDIODR)* as long as this bit is set.

For write transfers, the application must first write 16-bit data in the GD field (and also RA field when C45E is set) in *MDIO data register (ETH_MACMDIODR)* register before setting this bit. When C45E is set, it should also write into the RA field of *MDIO data register (ETH_MACMDIODR)* before initiating a read transfer. When a read transfer is completed (GMII busy=0), the data read from the PHY register is valid in the GD field of the *MDIO data register (ETH_MACMDIODR)*.

Note: Even if the addressed PHY is not present, there is no change in the functionality of this bit.

MDIO data register (ETH_MACMDIODR)

Address offset: 0x0204

Reset value: 0x0000 0000

The MDIO Data register stores the Write data to be written to the PHY register located at the address specified in *MDIO address register (ETH_MACMDIOAR)* This register also stores the Read data from the PHY register located at the address specified by MDIO Address register.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

GD[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 **RA[15:0]**: Register Address

This field is valid only when C45E is set. It contains the Register Address in the PHY to which the MDIO frame is intended for.

Bits 15:0 **GD[15:0]**: GMII Data

This field contains the 16-bit data value read from the PHY after a Management Read operation or the 16-bit data value to be written to the PHY before a Management Write operation.

ARP address register (ETH_MACARPAR)

Address offset: 0x0210

Reset value: 0x0000 0000

The ARP Address register contains the IPv4 Destination Address of the MAC.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
ARPPA[31:16]

ARPPA[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **ARPPA[31:0]**: ARP Protocol Address

This field contains the IPv4 Destination Address of the MAC. This address is used for perfect match with the Protocol Address of Target field in the received ARP packet.

CSR software control register (ETH_MACCSRSWCR)

Address offset: 0x0230

Reset value: 0x0000 0000

This register contains software-programmable controls for changing the CSR access response and status bits clearing.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	SEEN	Res.	Res.	Res.	Res.	Res.	Res.	Res.	RCWE
							rw								rw

Bits 31:9 Reserved, must be kept at reset value.

Bit 8 **SEEN**: Slave Error Response Enable

When this bit is set, the MAC responds with a Slave Error for accesses to reserved registers in CSR space.

When this bit is reset, the MAC responds with an Okay response to any register accessed from CSR space.

Bits 7:1 Reserved, must be kept at reset value.

Bit 0 **RCWE**: Register Clear on Write 1 Enable

When this bit is set, the access mode to some register fields changes to rc_w1 (clear on write) meaning that the application needs to set that respective bit to 1 to clear it.

When this bit is reset, the access mode to these register fields remains rc_r (clear on read).

MAC Address 0 high register (ETH_MACA0HR)

Address offset: 0x0300

Reset value: 0x8000 FFFF

The MAC Address0 High register holds the upper 16 bits of the first 6-byte MAC address of the station. The first DA byte that is received on the GMII interface corresponds to the LS byte (Bits [7:0]) of the MAC Address Low register. For example, if 0x112233445566 is received (0x11 in lane 0 of the first column) on the GMII as the destination address, then the MacAddress0 Register [47:0] is compared with 0x665544332211.

If the MAC address registers are configured to be double-synchronized to the GMII clock domains, then the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the MAC Address0 Low Register are written. For proper synchronization updates, the consecutive writes to this Address Low Register should be performed after at least four clock cycles in the destination clock domain.

Bit 31 **AE**: Address Enable

This bit is always set to 1.

Bits 30:16 Reserved, must be kept at reset value.

Bits 15:0 **ADDRHI[15:0]**: MAC Address0[47:32]

This field contains the upper 16 bits [47:32] of the first 6-byte MAC address. The MAC uses this field for filtering the received packets and inserting the MAC address in the Transmit Flow Control (Pause) Packets.

MAC Address x low register (ETH_MACAxLR)

Address offset: 0x0304 + 0x8 * x, (x = 0 to 3)

Reset value: 0xFFFF FFFF

The MAC Address x Low register holds the lower 32 bits of the 6-byte first MAC address of the station.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w

Bits 31:0 **ADDRLO[31:0]**: MAC Address x [31:0] (x = 0 to 3)

This field contains the lower 32 bits of the first 6-byte MAC address. The MAC uses this field for filtering the received packets and inserting the MAC address in the Transmit Flow Control (Pause) Packets.

MAC Address x high register (ETH_MACAxHR)

Address offset: 0x0308 + 0x8 * (x-1), (x = 1 to 3)

Reset value: 0x0000 FFFF

The MAC Address x High register holds the upper 16 bits of the second 6-byte MAC address of the station.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

ADDRHI[15:0]																
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	

Bit 31 **AE**: Address Enable

When this bit is set, the address filter module uses the second MAC address for perfect filtering. When this bit is reset, the address filter module ignores the address for filtering.

Bit 30 **SA**: Source Address

When this bit is set, the MAC Addressx[47:0] is used to compare with the SA fields of the received packet. When this bit is reset, the MAC Address x[47:0] is used to compare with the DA fields of the received packet.

- 0: DA
- 1: SA

Bits 29:24 **MBC[5:0]**: Mask Byte Control

These bits are mask control bits for comparing each of the MAC Address bytes. When set high, the MAC does not compare the corresponding byte of received DA or SA with the contents of MAC Address1 registers. Each bit controls the masking of the bytes as follows:

- Bit 29: ETH_MACAxHR[15:8]
- Bit 28: ETH_MACAxHR[7:0]
- Bit 27: ETH_MACAxLR[31:24]
- Bit 26: ETH_MACAxLR[23:16]
- Bit 25: ETH_MACAxLR[15:8]
- Bit 24: ETH_MACAxLR[7:0]

You can filter a group of addresses (known as group address filtering) by masking one or more bytes of the address.

Bits 23:16 Reserved, must be kept at reset value.

Bits 15:0 **ADDRHI[15:0]**: MAC Address1 [47:32]

This field contains the upper 16 bits[47:32] of the second 6-byte MAC address.

MMC control register (ETH_MMC_CONTROL)

Address offset: 0x0700

Reset value: 0x0000 0000

This register configures the MMC operating mode.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	UCDBC	Res.	Res.	CNTPRSTLVL	CNTPRST	CNTFREEZ	RSTONRD	CNTSTOPRO	CNTRST
							rw			rw	rw	rw	rw	rw	rw

Bits 31:9 Reserved, must be kept at reset value.

Bit 8 UCDBC: Update MMC Counters for Dropped Broadcast Packets

The CNTRST bit has a higher priority than the CNTPRST bit. Therefore, when the software tries to set both bits in the same write cycle, all counters are cleared and the CNTPRST bit is not set.

When set, the MAC updates all related MMC Counters for Broadcast packets that are dropped because of the setting of the DBF bit of [Packet filtering control register \(ETH_MACPFR\)](#).

When reset, the MMC Counters are not updated for dropped Broadcast packets.

Bits 7:6 Reserved, must be kept at reset value.

Bit 5 CNTPRSTLVL: Full-Half Preset

When this bit is low and the CNTPRST bit is set, all MMC counters get preset to almost-half value. All octet counters get preset to 0x7FFF_F800 (Half 2Kbytes) and all packet-counters get preset to 0x7FFF_FFF0 (Half 16).

When this bit is high and the CNTPRST bit is set, all MMC counters get preset to almost-full value. All octet counters get preset to 0xFFFF_F800 (Full 2Kbytes) and all packet-counters get preset to 0xFFFF_FFF0 (Full 16).

For 16-bit counters, the almost-half preset values are 0x7800 and 0x7FF0 for the respective octet and packet counters. Similarly, the almost-full preset values for the 16-bit counters are 0xF800 and 0xFF0.

Bit 4 CNTPRST: Counters Preset

When this bit is set, all counters are initialized or preset to almost full or almost half according to the CNTPRSTLVL bit. This bit is cleared automatically after 1 clock cycle.

This bit, along with the CNTPRSTLVL bit, is useful for debugging and testing the assertion of interrupts because of MMC counter becoming half-full or full.

Bit 3 CNTFREEZ: MMC Counter Freeze

When this bit is set, it freezes all MMC counters to their current value.

Until this bit is reset to 0, no MMC counter is updated because of any transmitted or received packet. If any MMC counter is read with the Reset on Read bit set, then that counter is also cleared in this mode.

Bit 2 **RSTONRD**: Reset on Read

When this bit is set, the MMC counters are reset to zero after Read (self-clearing after reset). The counters are cleared when the least significant byte lane (Bits[7:0]) is read.

Bit 1 **CNTSTOPRO**: Counter Stop Rollover

When this bit is set, the counter does not roll over to zero after reaching the maximum value.

Bit 0 **CNTRST**: Counters Reset

When this bit is set, all counters are reset. This bit is cleared automatically after 1 clock cycle.

MMC Rx interrupt register (ETH_MMC_RX_INTERRUPT)

Address offset: 0x0704

Reset value: 0x0000 0000

This register maintains the interrupts generated from all Receive statistics counters.

The MMC Receive Interrupt register maintains the interrupts that are generated when the following occur:

- Receive statistic counters reach half of their maximum values (0x8000_0000 for 32 bit counter and 0x8000 for 16 bit counter).
- Receive statistic counters cross their maximum values (0xFFFF_FFFF for 32 bit counter and 0xFFFF for 16 bit counter).

When the CNTSTOPRO is set in *MMC control register (ETH_MMC_CONTROL)*, interrupts are set but the counter remains at all-ones. The MMC Receive Interrupt register is a 32 bit register. An interrupt bit is cleared when the respective MMC counter that caused the interrupt is read. The least significant byte lane (Bits[7:0]) of the respective counter must be read to clear the interrupt bit.

Bits 31:28 Reserved, must be kept at reset value.

Bit 27 **RXLPITRCIS**: MMC Receive LPI transition counter interrupt status

This bit is set when the *Rx LPI transition counter register (ETH_RX_LPI_TRAN_CNTR)* counter reaches half of the maximum value or the maximum value.

Bit 26 **RXLPUIUSCIS**: MMC Receive LPI microsecond counter interrupt status

This bit is set when the *Rx LPI microsecond counter register (ETH_RX_LPI_USEC_CNTR)* counter reaches half of the maximum value or the maximum value.

Bits 25:18 Reserved, must be kept at reset value.

Bit 17 **RXUCGPIS**: MMC Receive Unicast Good Packet Counter Interrupt Status

This bit is set when the *Rx unicast packets good register (ETH_RX_UNICAST_PACKETS_GOOD)* counter reaches half of the maximum value or the maximum value.

Bits 16:7 Reserved, must be kept at reset value.

Bit 6 **RXALGNRPIS**: MMC Receive Alignment Error Packet Counter Interrupt Status

This bit is set when the *Rx alignment error packets register (ETH_RX_ALIGNMENT_ERROR_PACKETS)* counter reaches half of the maximum value or the maximum value.

Bit 5 **RXCRCERPIS**: MMC Receive CRC Error Packet Counter Interrupt Status

This bit is set when the *Rx CRC error packets register (ETH_RX_CRC_ERROR_PACKETS)* counter reaches half of the maximum value or the maximum value.

Bits 4:0 Reserved, must be kept at reset value.

MMC Tx interrupt register (ETH_MMC_TX_INTERRUPT)

Address offset: 0x0708

Reset value: 0x0000 0000

This register maintains the interrupts generated from all Transmit statistics counters.

The MMC Transmit Interrupt register maintains the interrupts generated when transmit statistic counters reach half their maximum values (0x8000_0000 for 32 bit counter and 0x8000 for 16 bit counter), and when they cross their maximum values (0xFFFF_FFFF for 32-bit counter and 0xFFFF for 16-bit counter).

When CNTSTOPRO is set in *MMC control register (ETH_MMC_CONTROL)*, the interrupts are set but the counter remains at all-ones.

The MMC Transmit Interrupt register is a 32 bit register. An interrupt bit is cleared when the respective MMC counter that caused the interrupt is read.

The least significant byte lane (Bits[7:0]) of the respective counter must be read to clear the interrupt bit.

- Bits 31:28 Reserved, must be kept at reset value.
- Bit 27 **TXLPITRCIS**: MMC Transmit LPI transition counter interrupt status
This bit is set when the *Tx LPI transition counter register (ETH_TX_LPI_TRAN_CNTR)* counter reaches half of the maximum value or the maximum value.
- Bit 26 **TXLPIUSCIS**: MMC Transmit LPI microsecond counter interrupt status
This bit is set when the *Tx LPI microsecond timer register (ETH_TX_LPI_USEC_CNTR)* counter reaches half of the maximum value or the maximum value.
- Bits 25:22 Reserved, must be kept at reset value.
- Bit 21 **TXGPKTIS**: MMC Transmit Good Packet Counter Interrupt Status
This bit is set when the *Tx packet count good register (ETH_TX_PACKET_COUNT_GOOD)* counter reaches half of the maximum value or the maximum value.
- Bits 20:16 Reserved, must be kept at reset value.
- Bit 15 **TXMCOGPIS**: MMC Transmit Multiple Collision Good Packet Counter Interrupt Status
This bit is set when the *Tx multiple collision good packets register (ETH_TX_MULTIPLE_COLLISION_GOOD_PACKETS)* counter reaches half of the maximum value or the maximum value.
- Bit 14 **TXSCOLGPIS**: MMC Transmit Single Collision Good Packet Counter Interrupt Status
This bit is set when the *Tx single collision good packets register (ETH_TX_SINGLE_COLLISION_GOOD_PACKETS)* counter reaches half of the maximum value or the maximum value.
- Bits 13:0 Reserved, must be kept at reset value.

MMC Rx interrupt mask register (ETH_MMC_RX_INTERRUPT_MASK)

Address offset: 0x070C

Reset value: 0x0000 0000

The MMC Receive Interrupt Mask register maintains the masks for the interrupts generated when receive statistic counters reach half of their maximum value or the maximum values.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

									rw	rw					

Bits 31:28 Reserved, must be kept at reset value.

Bit 27 **RXLPI TRCIM**: MMC Receive LPI transition counter interrupt Mask
 Setting this bit masks the interrupt when the *Rx LPI transition counter register (ETH_RX_LPI_TRAN_CNTR)* counter reaches half of the maximum value or the maximum value.

Bit 26 **RXLPI USCIM**: MMC Receive LPI microsecond counter interrupt Mask
 Setting this bit masks the interrupt when the *Rx LPI microsecond counter register (ETH_RX_LPI_USEC_CNTR)* counter reaches half of the maximum value or the maximum value.

Bits 25:18 Reserved, must be kept at reset value.

Bit 17 **RXUCGPIM**: MMC Receive Unicast Good Packet Counter Interrupt Mask
 Setting this bit masks the interrupt when the *Rx unicast packets good register (ETH_RX_UNICAST_PACKETS_GOOD)* counter reaches half of the maximum value or the maximum value.

Bits 16:7 Reserved, must be kept at reset value.

Bit 6 **RXALGNERPIM**: MMC Receive Alignment Error Packet Counter Interrupt Mask
 Setting this bit masks the interrupt when the *Rx alignment error packets register (ETH_RX_ALIGNMENT_ERROR_PACKETS)* counter reaches half of the maximum value or the maximum value.

Bit 5 **RXCRCERPIM**: MMC Receive CRC Error Packet Counter Interrupt Mask
 Setting this bit masks the interrupt when the *Rx CRC error packets register (ETH_RX_CRC_ERROR_PACKETS)* counter reaches half of the maximum value or the maximum value.

Bits 4:0 Reserved, must be kept at reset value.

MMC Tx interrupt mask register (ETH_MMC_TX_INTERRUPT_MASK)

Address offset: 0x0710

Reset value: 0x0000 0000

The MMC Transmit Interrupt Mask register maintains the masks for the interrupts generated when the transmit statistic counters reach half of their maximum value or the maximum values. This register is 32 bit wide.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

r/w	r/w														

Bits 31:28 Reserved, must be kept at reset value.

Bit 27 **TXLPITRCIM**: MMC Transmit LPI transition counter interrupt Mask
 Setting this bit masks the interrupt when the *Tx LPI transition counter register (ETH_TX_LPI_TRAN_CNTR)* counter reaches half of the maximum value or the maximum value.

Bit 26 **TXLPIUSCIM**: MMC Transmit LPI microsecond counter interrupt Mask
 Setting this bit masks the interrupt when the *Tx LPI microsecond timer register (ETH_TX_LPI_USEC_CNTR)* counter reaches half of the maximum value or the maximum value.

Bits 25:22 Reserved, must be kept at reset value.

Bit 21 **TXGPKTIM**: MMC Transmit Good Packet Counter Interrupt Mask
 Setting this bit masks the interrupt when the *Tx packet count good register (ETH_TX_PACKET_COUNT_GOOD)* counter reaches half of the maximum value or the maximum value.

Bits 20:16 Reserved, must be kept at reset value.

Bit 15 **TXMCOLGPIM**: MMC Transmit Multiple Collision Good Packet Counter Interrupt Mask
 Setting this bit masks the interrupt when the *Tx multiple collision good packets register (ETH_TX_MULTIPLE_COLLISION_GOOD_PACKETS)* counter reaches half of the maximum value or the maximum value.

Bit 14 **TXSCOLGPIM**: MMC Transmit Single Collision Good Packet Counter Interrupt Mask
 Setting this bit masks the interrupt when the *Tx single collision good packets register (ETH_TX_SINGLE_COLLISION_GOOD_PACKETS)* counter reaches half of the maximum value or the maximum value.

Bits 13:0 Reserved, must be kept at reset value.

**Tx single collision good packets register
(ETH_TX_SINGLE_COLLISION_GOOD_PACKETS)**

Address offset: 0x074C

Reset value: 0x0000 0000

This register provides the number of successfully transmitted packets by Ethernet peripheral after a single collision in the Half-duplex mode.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **TXSNGLCOLG[31:0]**: Tx Single Collision Good Packets

This field indicates the number of successfully transmitted packets after a single collision in the Half-duplex mode.

**Tx multiple collision good packets register
(ETH_TX_MULTIPLE_COLLISION_GOOD_PACKETS)**

Address offset: 0x0750

Reset value: 0x0000 0000

This register provides the number of successfully transmitted packets by Ethernet peripheral after multiple collisions in the Half-duplex mode.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **TXMULTCOLG[31:0]**: Tx Multiple Collision Good Packets

This field indicates the number of successfully transmitted packets after multiple collisions in the Half-duplex mode.

Tx packet count good register (ETH_TX_PACKET_COUNT_GOOD)

Address offset: 0x0768

Reset value: 0x0000 0000

This register provides the number of good packets transmitted by Ethernet peripheral.

Bits 31:0 **TXPKTG[31:0]**: Tx Packet Count Good

This field indicates the number of good packets transmitted.

Rx CRC error packets register (ETH_RX_CRC_ERROR_PACKETS)

Address offset: 0x0794

Reset value: 0x0000 0000

This register provides the number of packets received by Ethernet peripheral with CRC error.

Bits 31:0 **RXCRCERR[31:0]**: Rx CRC Error Packets

This field indicates the number of packets received with CRC error.

Rx alignment error packets register (ETH_RX_ALIGNMENT_ERROR_PACKETS)

Address offset: 0x0798

Reset value: 0x0000 0000

This register provides the number of packets received by Ethernet peripheral with alignment (dribble) error. It is valid only in 10/100 mode.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

RXALGNERR[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **RXALGNERR[31:0]**: Rx Alignment Error Packets

This field indicates the number of packets received with alignment (dribble) error. It is valid only in 10/100 mode.

Rx unicast packets good register (ETH_RX_UNICAST_PACKETS_GOOD)

Address offset: 0x07C4

Reset value: 0x0000 0000

This register provides the number of good unicast packets received by Ethernet peripheral.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
RXUNICASTG[31:16]

RXUNICASTG[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **RXUNICASTG[31:0]**: Rx Unicast Packets Good

This field indicates the number of good unicast packets received.

Tx LPI microsecond timer register (ETH_TX_LPI_USEC_CNTR)

Address offset: 0x07EC

Reset value: 0x0000 0000

This register provides the number of microseconds Tx LPI is asserted by Ethernet peripheral.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
TXLPIUSC[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

TXLPIUSC[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **TXLPIUSC[31:0]**: Tx LPI Microseconds Counter

This field indicates the number of microseconds Tx LPI is asserted. For every Tx LPI Entry and Exit, the Timer value can have an error of +/- 1 microsecond.

Tx LPI transition counter register (ETH_TX_LPI_TRAN_CNTR)

Address offset: 0x07F0

Reset value: 0x0000 0000

This register provides the number of times Ethernet peripheral has entered Tx LPI.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
TXLPITRC[31:16]

TXLPITRC[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **TXLPITRC[31:0]**: Tx LPI Transition counter

This field indicates the number of times Tx LPI Entry has occurred. Even if Tx LPI Entry occurs in Automate mode (because of LPITXA bit set in the *LPI control and status register (ETH_MACLCSR)*), the counter increments.

Rx LPI microsecond counter register (ETH_RX_LPI_USEC_CNTR)

Address offset: 0x07F4

Reset value: 0x0000 0000

This register provides the number of microseconds Rx LPI is sampled by Ethernet peripheral.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **RXLPIUSC[31:0]**: Rx LPI Microseconds Counter

This field indicates the number of microseconds Rx LPI is asserted. For every Rx LPI Entry and Exit, the Timer value can have an error of +/- 1 microsecond.

Rx LPI transition counter register (ETH_RX_LPI_TRAN_CNTR)

Address offset: 0x07F8

Reset value: 0x0000 0000

This register provides the number of times Ethernet peripheral has entered Rx LPI.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

RXLPITRC[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **RXLPITRC[31:0]**: Rx LPI Transition counter

This field indicates the number of times Rx LPI Entry has occurred.

L3 and L4 control 0 register (ETH_MACL3L4C0R)

Address offset: 0x0900

Reset value: 0x0000 0000

The Layer 3 and Layer 4 Control register controls the operations of filter 0 of Layer 3 and Layer 4.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	L4DPIM0	L4DPM0	L4SPIM0	L4SPM0	Res.	L4PEN0

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw		rw

Bits 31:22 Reserved, must be kept at reset value.

Bit 21 **L4DPIM0**: Layer 4 Destination Port Inverse Match Enable

When this bit is set, the Layer 4 Destination Port number field is enabled for inverse matching. When this bit is reset, the Layer 4 Destination Port number field is enabled for perfect matching.

This bit is valid and applicable only when the L4DPM0 bit is set high.

Bit 20 **L4DPM0**: Layer 4 Destination Port Match Enable

When this bit is set, the Layer 4 Destination Port number field is enabled for matching. When this bit is reset, the MAC ignores the Layer 4 Destination Port number field for matching.

Bit 19 **L4SPIM0**: Layer 4 Source Port Inverse Match Enable

When this bit is set, the Layer 4 Source Port number field is enabled for inverse matching. When this bit is reset, the Layer 4 Source Port number field is enabled for perfect matching.

This bit is valid and applicable only when the L4SPM0 bit is set high.

Bit 18 **L4SPM0**: Layer 4 Source Port Match Enable

When this bit is set, the Layer 4 Source Port number field is enabled for matching. When this bit is reset, the MAC ignores the Layer 4 Source Port number field for matching.

Bit 17 Reserved, must be kept at reset value.

Bit 16 **L4PEN0**: Layer 4 Protocol Enable

When this bit is set, the Source and Destination Port number fields of UDP packets are used for matching. When this bit is reset, the Source and Destination Port number fields of TCP packets are used for matching.

The Layer 4 matching is done only when the L4SPM0 or L4DPM0 bit is set.

Bits 15:11 **L3HDBM0[4:0]**: Layer 3 IP DA higher bits match

Condition: IPv4 packets

This field contains the number of higher bits of IP Destination Address that are masked in the IPv4 packets:

0: No bits are masked.

1: LSb[0] is masked

2: Two LSbs [1:0] are masked

..

31: All bits except MSb are masked.

Condition: IPv6 packets

Bits[12:11] of this field correspond to Bits[6:5] of L3HSBM0 which indicate the number of lower bits of IP Source or Destination Address that are masked in the IPv6 packets. Number of bits masked is given by concatenated values of the L3HDBM0[1:0] and L3HSBM0 bits:

0: No bits are masked.

1: LSb[0] is masked

2: Two LSbs [1:0] are masked

..

31: All bits except MSb are masked.

This field is valid and applicable only when the L3DAM0 or L3SAM0 bit is set.

Bits 10:6 **L3HSBM0[4:0]**: Layer 3 IP SA higher bits match

Condition: IPv4 packets

This field contains the number of lower bits of IP source address that are masked for matching in the IPv4 packets. The following list describes the values of this field:

0: No bits are masked.

1: LSb[0] is masked

2: Two LSbs [1:0] are masked

..

31: All bits except MSb are masked.

Condition: IPv6 packets:

This field contains Bits[4:0] of L3HSBM0. These bits indicate the number of higher bits of IP source or destination address matched in the IPv6 packets. This field is valid and applicable only when the L3DAM0 or L3SAM0 bit is set high.

Bit 5 **L3DAIM0**: Layer 3 IP DA Inverse Match Enable

When this bit is set, the Layer 3 IP Destination Address field is enabled for inverse matching. When this bit is reset, the Layer 3 IP Destination Address field is enabled for perfect matching.

This bit is valid and applicable only when the L3DAM0 bit is set high.

Bit 4 **L3DAM0**: Layer 3 IP DA Match Enable

When this bit is set, the Layer 3 IP Destination Address field is enabled for matching. When this bit is reset, the MAC ignores the Layer 3 IP Destination Address field for matching.

Note: When the L3PEN0 bit is set, you should set either this bit or the L3SAM0 bit because either IPv6 DA or SA can be checked for filtering.

Bit 3 **L3SAIM0**: Layer 3 IP SA Inverse Match Enable

When this bit is set, the Layer 3 IP Source Address field is enabled for inverse matching.

When this bit reset, the Layer 3 IP Source Address field is enabled for perfect matching.

This bit is valid and applicable only when the L3SAM0 bit is set.

Bit 2 **L3SAM0**: Layer 3 IP SA Match Enable

When this bit is set, the Layer 3 IP Source Address field is enabled for matching. When this bit is reset, the MAC ignores the Layer 3 IP Source Address field for matching.

Note: When the L3PEN0 bit is set, you should set either this bit or the L3DAM0 bit because either IPv6 SA or DA can be checked for filtering.

Bit 1 Reserved, must be kept at reset value.

Bit 0 **L3PEN0**: Layer 3 Protocol Enable

When this bit is set, the Layer 3 IP Source or Destination Address matching is enabled for IPv6 packets. When this bit is reset, the Layer 3 IP Source or Destination Address matching is enabled for IPv4 packets.

The Layer 3 matching is done only when the L3SAM0 or L3DAM0 bit is set.

Layer4 Address filter 0 register (ETH_MACL4A0R)

Address offset: 0x0904

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
L4DP0[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
L4SP0[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 **L4DP0[15:0]**: Layer 4 Destination Port Number Field

When the L4PEN0 bit is reset and the L4DPM0 bit is set in the [L3 and L4 control 0 register \(ETH_MACL3L4C0R\)](#), this field contains the value to be matched with the TCP Destination Port Number field in the IPv4 or IPv6 packets.

When the L4PEN0 and L4DPM0 bits are set in [L3 and L4 control 0 register \(ETH_MACL3L4C0R\)](#), this field contains the value to be matched with the UDP Destination Port Number field in the IPv4 or IPv6 packets.

Bits 15:0 **L4SP0[15:0]**: Layer 4 Source Port Number Field

When the L4PEN0 bit is reset and the L4DPM0 bit is set in the [L3 and L4 control 0 register \(ETH_MACL3L4C0R\)](#), this field contains the value to be matched with the TCP Source Port Number field in the IPv4 or IPv6 packets.

When the L4PEN0 and L4DPM0 bits are set in [L3 and L4 control 0 register \(ETH_MACL3L4C0R\)](#), this field contains the value to be matched with the UDP Source Port Number field in the IPv4 or IPv6 packets.

Layer3 Address 0 filter 0 register (ETH_MACL3A00R)

Address offset: 0x0910

Reset value: 0x0000 0000

For IPv4 packets, the Layer 3 Address 0 filter 0 register contains the 32-bit IP Source Address field. For IPv6 packets, it contains Bits[31:0] of the 128-bit IP Source Address or Destination Address field.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bits 31:0 **L3A00[31:0]**: Layer 3 Address 0 Field

When the L3PEN0 and L3SAM0 bits are set in the [L3 and L4 control 0 register \(ETH_MACL3L4C0R\)](#), this field contains the value to be matched with Bits[31:0] of the IP Source Address field in the IPv6 packets.

When the L3PEN0 and L3DAM0 bits are set in the [L3 and L4 control 0 register \(ETH_MACL3L4C0R\)](#), this field contains the value to be matched with Bits[31:0] of the IP Destination Address field in the IPv6 packets.

When the L3PEN0 bit is reset and the L3SAM0 bit is set in the [L3 and L4 control 0 register \(ETH_MACL3L4C0R\)](#), this field contains the value to be matched with the IP Source Address field in the IPv4 packets.

Layer3 Address 1 filter 0 register (ETH_MACL3A10R)

Address offset: 0x0914

Reset value: 0x0000 0000

For IPv4 packets, the Layer 3 Address 1 filter 0 register contains the 32-bit IP Destination Address field. For IPv6 packets, it contains Bits[63:32] of the 128-bit IP Source Address or Destination Address field.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bits 31:0 **L3A10[31:0]**: Layer 3 Address 1 Field

When the L3PEN0 and L3SAM0 bits are set in the *L3 and L4 control 0 register (ETH_MACL3L4C0R)*, this field contains the value to be matched with Bits[63:32] of the IP Source Address field in the IPv6 packets.

When the L3PEN0 and L3DAM0 bits are set in the *L3 and L4 control 0 register (ETH_MACL3L4C0R)*, this field contains the value to be matched with Bits[63:32] of the IP Destination Address field in the IPv6 packets.

When the L3PEN0 bit is reset and the L3SAM0 bit is set in the *L3 and L4 control 0 register (ETH_MACL3L4C0R)*, this field contains the value to be matched with the IP Destination Address field in the IPv4 packets.

Layer3 Address 2 filter 0 register (ETH_MACL3A20R)

Address offset: 0x0918

Reset value: 0x0000 0000

The Layer 3 Address 2 filter 0 register is reserved for IPv4 packets. For IPv6 packets, it contains Bits[95:64] of 128-bit IP Source Address or Destination Address field.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **L3A20[31:0]**: Layer 3 Address 2 Field

When the L3PEN0 and L3SAM0 bits are set in the *L3 and L4 control 0 register (ETH_MACL3L4C0R)*, this field contains the value to be matched with Bits[95:64] of the IP Source Address field in the IPv6 packets.

When the L3PEN0 and L3DAM0 bits are set in the *L3 and L4 control 0 register (ETH_MACL3L4C0R)*, this field contains the value to be matched with Bits[95:64] of the IP Destination Address field in the IPv6 packets.

When the L3PEN0 bit is reset in the *L3 and L4 control 0 register (ETH_MACL3L4C0R)*, this field is not used.

Layer3 Address 3 filter 0 register (ETH_MACL3A30R)

Address offset: 0x091C

Reset value: 0x0000 0000

The Layer 3 Address 3 filter 0 register is reserved for IPv4 packets. For IPv6 packets, it contains Bits[127:96] of 128-bit IP Source Address or Destination Address field.

Bits 31:0 **L3A30[31:0]**: Layer 3 Address 3 Field

When the L3PEN0 and L3SAM0 bits are set in the *L3 and L4 control 0 register (ETH_MACL3L4C0R)*, this field contains the value to be matched with Bits[127:96] of the IP Source Address field in the IPv6 packets.

When the L3PEN0 and L3DAM0 bits are set in the *L3 and L4 control 0 register (ETH_MACL3L4C0R)*, this field contains the value to be matched with Bits[127:96] of the IP Destination Address field in the IPv6 packets.

When the L3PEN0 bit is reset in the *L3 and L4 control 0 register (ETH_MACL3L4C0R)*, this field is not used.

L3 and L4 control 1 register (ETH_MACL3L4C1R)

Address offset: 0x0930

Reset value: 0x0000 0000

The Layer 3 and Layer 4 Control register controls the operations of filter 1 of Layer 3 and Layer 4.

Bits 31:22 Reserved, must be kept at reset value.

Bit 21 **L4DPIM1**: Layer 4 Destination Port Inverse Match Enable

When this bit is set, the Layer 4 Destination Port number field is enabled for inverse matching. When this bit is reset, the Layer 4 Destination Port number field is enabled for perfect matching.

This bit is valid and applicable only when the L4DPM1 bit is set high.

Bit 20 **L4DPM1**: Layer 4 Destination Port Match Enable

When this bit is set, the Layer 4 Destination Port number field is enabled for matching. When this bit is reset, the MAC ignores the Layer 4 Destination Port number field for matching.

Bit 19 **L4SPIM1**: Layer 4 Source Port Inverse Match Enable

When this bit is set, the Layer 4 Source Port number field is enabled for inverse matching. When this bit is reset, the Layer 4 Source Port number field is enabled for perfect matching.

This bit is valid and applicable only when the L4SPM1 bit is set high.

Bit 18 **L4SPM1**: Layer 4 Source Port Match Enable

When this bit is set, the Layer 4 Source Port number field is enabled for matching. When this bit is reset, the MAC ignores the Layer 4 Source Port number field for matching.

Bit 17 Reserved, must be kept at reset value.

Bit 16 L4PEN1: Layer 4 Protocol Enable

When this bit is set, the Source and Destination Port number fields of UDP packets are used for matching. When this bit is reset, the Source and Destination Port number fields of TCP packets are used for matching.

The Layer 4 matching is done only when the L4SPM1 or L4DPM1 bit is set.

Bits 15:11 L3HDBM1[4:0]: Layer 3 IP DA higher bits match

Condition: IPv4 packets

This field contains the number of lower bits of IP Destination Address that are masked for matching in the IPv4 packets. The following list describes the values of this field:

0: No bits are masked.

1: LSb[0] is masked

2: Two LSbs [1:0] are masked

..

31: All bits except MSb are masked.

Condition: IPv6 packets

Bits[12:11] of this field correspond to Bits[6:5] of L3HSBM1, which indicate the number of lower bits of IP Source or Destination Address that are masked in the IPv6 packets. The following list describes the concatenated values of the L3HDBM1[1:0] and L3HSBM1 bits:

0: No bits are masked

1: LSb[0] is masked

2: Two LSbs [1:0] are masked

..

127: All bits except MSb are masked

This field is valid and applicable only when the L3DAM1 or L3SAM1 bit is set.

Bits 10:6 L3HSBM1[4:0]: Layer 3 IP SA Higher Bits Match

Condition: IPv4 packets

This field contains the number of lower bits of IP Source Address that are masked for matching in the IPv4 packets. The following list describes the values of this field:

0: No bits are masked.

1: LSb[0] is masked

2: Two LSbs [1:0] are masked

..

31: All bits except MSb are masked.

Condition: IPv6 packets

This field contains Bits[4:0] of L3HSBM1. These bits indicate the number of higher bits of IP Source or Destination Address matched in the IPv6 packets. This field is valid and applicable only when the L3DAM1 or L3SAM1 bit is set high.

Bit 5 L3DAIM1: Layer 3 IP DA Inverse Match Enable

When this bit is set, the Layer 3 IP Destination Address field is enabled for inverse matching. When this bit is reset, the Layer 3 IP Destination Address field is enabled for perfect matching.

This bit is valid and applicable only when the L3DAM1 bit is set high.

Bit 4 L3DAM1: Layer 3 IP DA Match Enable

When this bit is set, the Layer 3 IP Destination Address field is enabled for matching. When this bit is reset, the MAC ignores the Layer 3 IP Destination Address field for matching.

Note: When the L3PEN1 bit is set, you should set either this bit or the L3SAM1 bit because either IPv6 DA or SA can be checked for filtering.

Bit 3 **L3SAIM1**: Layer 3 IP SA Inverse Match Enable

When this bit is set, the Layer 3 IP Source Address field is enabled for inverse matching.
 When this bit reset, the Layer 3 IP Source Address field is enabled for perfect matching.
 This bit is valid and applicable only when the L3SAM1 bit is set.

Bit 2 **L3SAM1**: Layer 3 IP SA Match Enable

When this bit is set, the Layer 3 IP Source Address field is enabled for matching. When this bit is reset, the MAC ignores the Layer 3 IP Source Address field for matching.

Note: When the L3PEN01 bit is set, you should set either this bit or the L3DAM1 bit because either IPv6 SA or DA can be checked for filtering.

Bit 1 Reserved, must be kept at reset value.

Bit 0 **L3PEN1**: Layer 3 Protocol Enable

When this bit is set, the Layer 3 IP Source or Destination Address matching is enabled for IPv6 packets. When this bit is reset, the Layer 3 IP Source or Destination Address matching is enabled for IPv4 packets.

The Layer 3 matching is done only when the L3SAM1 or L3DAM1 bit is set.

Layer 4 address filter 1 register (ETH_MACL4A1R)

Address offset: 0x0934

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bits 31:16 **L4DP1[15:0]**: Layer 4 Destination Port Number Field

When the L4PEN1 bit is reset and the L4DPM1 bit is set in the [L3 and L4 control 1 register \(ETH_MACL3L4C1R\)](#), this field contains the value to be matched with the TCP Destination Port Number field in the IPv4 or IPv6 packets.

When the L4PEN1 and L4DPM1 bits are set in [L3 and L4 control 1 register \(ETH_MACL3L4C1R\)](#), this field contains the value to be matched with the UDP Destination Port Number field in the IPv4 or IPv6 packets.

Bits 15:0 **L4SP1[15:0]**: Layer 4 Source Port Number Field

When the L4PEN1 bit is reset and the L4DPM1 bit is set in the [L3 and L4 control 1 register \(ETH_MACL3L4C1R\)](#), this field contains the value to be matched with the TCP Source Port Number field in the IPv4 or IPv6 packets.

When the L4PEN1 and L4DPM1 bits are set in [L3 and L4 control 1 register \(ETH_MACL3L4C1R\)](#), this field contains the value to be matched with the UDP Source Port Number field in the IPv4 or IPv6 packets.

Layer3 address 0 filter 1 Register (ETH_MACL3A01R)

Address offset: 0x0940

Reset value: 0x0000 0000

For IPv4 packets, the Layer 3 Address 0 filter 1 register contains the 32-bit IP Source Address field. For IPv6 packets, it contains Bits[31:0] of the 128-bit IP Source Address or Destination Address field.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bits 31:0 **L3A01[31:0]**: Layer 3 Address 0 Field

When the L3PEN1 and L3SAM1 bits are set in the [L3 and L4 control 1 register \(ETH_MACL3L4C1R\)](#), this field contains the value to be matched with Bits[31:0] of the IP Source Address field in the IPv6 packets.

When the L3PEN1 and L3DAM1 bits are set in the [L3 and L4 control 1 register \(ETH_MACL3L4C1R\)](#), this field contains the value to be matched with Bits[31:0] of the IP Destination Address field in the IPv6 packets.

When the L3PEN1 bit is reset and the L3SAM1 bit is set in the [L3 and L4 control 1 register \(ETH_MACL3L4C1R\)](#), this field contains the value to be matched with the IP Source Address field in the IPv4 packets.

Layer3 address 1 filter 1 register (ETH_MACL3A11R)

Address offset: 0x0944

Reset value: 0x0000 0000

For IPv4 packets, the Layer 3 Address 1 filter 1 register contains the 32-bit IP Destination Address field. For IPv6 packets, it contains Bits[63:32] of the 128-bit IP Source Address or Destination Address field.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bits 31:0 **L3A11[31:0]**: Layer 3 Address 1 Field

When the L3PEN1 and L3SAM1 bits are set in the *L3 and L4 control 1 register (ETH_MACL3L4C1R)*, this field contains the value to be matched with Bits[63:32] of the IP Source Address field in the IPv6 packets.

When the L3PEN1 and L3DAM1 bits are set in the *L3 and L4 control 1 register (ETH_MACL3L4C1R)*, this field contains the value to be matched with Bits[63:32] of the IP Destination Address field in the IPv6 packets.

When the L3PEN1 bit is reset and the L3SAM1 bit is set in the *L3 and L4 control 1 register (ETH_MACL3L4C1R)*, this field contains the value to be matched with the IP Destination Address field in the IPv4 packets.

Layer3 address 2 filter 1 Register (ETH_MACL3A21R)

Address offset: 0x0948

Reset value: 0x0000 0000

The Layer 3 Address 2 filter 1 register is reserved for IPv4 packets. For IPv6 packets, it contains Bits[95:64] of 128-bit IP Source Address or Destination Address field.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bits 31:0 **L3A21[31:0]**: Layer 3 Address 2 Field

When the L3PEN1 and L3SAM1 bits are set in the *L3 and L4 control 1 register (ETH_MACL3L4C1R)*, this field contains the value to be matched with Bits[95:64] of the IP Source Address field in the IPv6 packets.

When the L3PEN1 and L3DAM1 bits are set in the *L3 and L4 control 1 register (ETH_MACL3L4C1R)*, this field contains the value to be matched with Bits[95:64] of the IP Destination Address field in the IPv6 packets.

When the L3PEN1 bit is reset in the *L3 and L4 control 1 register (ETH_MACL3L4C1R)*, this field is not used.

Layer3 address 3 filter 1 register (ETH_MACL3A31R)

Address offset: 0x94C

Reset value: 0x0000 0000

The Layer 3 Address 3 filter 1 register is reserved for IPv4 packets. For IPv6 packets, it contains Bits[127:96] of 128-bit IP Source Address or Destination Address field.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
L3A31[31:16]

L3A31[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **L3A31[31:0]**: Layer 3 Address 3 Field

When the L3PEN1 and L3SAM1 bits are set in the *L3 and L4 control 1 register (ETH_MACL3L4C1R)*, this field contains the value to be matched with Bits[127:96] of the IP Source Address field in the IPv6 packets.

When the L3PEN1 and L3DAM1 bits are set in the *L3 and L4 control 1 register (ETH_MACL3L4C1R)*, this field contains the value to be matched with Bits[127:96] of the IP Destination Address field in the IPv6 packets.

When the L3PEN1 bit is reset in the *L3 and L4 control 1 register (ETH_MACL3L4C1R)*, this field is not used.

Timestamp control Register (ETH_MACTSCR)

Address offset: 0x0B00

Reset value: 0x0000 2000

This register controls the operation of the System Time generator and processing of PTP packets for timestamping in the Receiver.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rW	rW	rW	rW	rW	rW	rW	rW			rW		rW	rW	rW	rW

Bits 31:29 Reserved, must be kept at reset value.

Bit 28 **AV8021ASMEN**: AV 802.1AS Mode Enable

When this bit is set, the MAC processes only untagged PTP over Ethernet packets for providing PTP status and capturing timestamp snapshots, that is, IEEE 802.1AS operating mode.

When PTP offload feature is enabled, for the purpose of PTP offload, the transport specific field in the PTP header is generated and checked based on the value of this bit.

Bits 27:25 Reserved, must be kept at reset value.

Bit 24 **TXTSSTSM**: Transmit Timestamp Status Mode

When this bit is set, the MAC overwrites the earlier transmit timestamp status even if it is not read by the software. The MAC indicates this by setting the TXTSSMIS bit of the *Tx timestamp status nanoseconds register (ETH_MACTXTSSNR)* register.

When this bit is reset, the MAC ignores the timestamp status of current packet if the timestamp status of previous packet is not read by the software. The MAC indicates this by setting the TXTSSMIS bit of the *Tx timestamp status nanoseconds register (ETH_MACTXTSSNR)*.

Bits 23:19 Reserved, must be kept at reset value.

- Bit 18 **TSENMADDR**: Enable MAC Address for PTP Packet Filtering
 When this bit is set, the DA MAC address (that matches any MAC Address register) is used to filter the PTP packets when PTP is directly sent over Ethernet.
 When this bit is set, received PTP packets with DA containing a special multicast or unicast address that matches the one programmed in MAC address registers are considered for processing as indicated below, when PTP is directly sent over Ethernet.
 For normal timestamping operation, MAC address registers 0 to 31 is considered for unicast destination address matching.
 For PTP offload, only MAC address register 0 is considered for unicast destination address matching.
- Bits 17:16 **SNAPTYPSEL[1:0]**: Select PTP packets for Taking Snapshots
 These bits, along with Bits 15 and 14, define the set of PTP packet types for which snapshot needs to be taken. The encoding is given in [Table 511: Timestamp Snapshot Dependency on ETH_MACTSCR Bits](#).
- Bit 15 **TSMSTRENA**: Enable Snapshot for Messages Relevant to Master
 When this bit is set, the snapshot is taken only for the messages that are relevant to the master node. Otherwise, the snapshot is taken for the messages relevant to the slave node.
- Bit 14 **TSEVNTENA**: Enable Timestamp Snapshot for Event Messages
 When this bit is set, the timestamp snapshot is taken only for event messages (SYNC, Delay_Req, Pdelay_Req, or Pdelay_Resp). When this bit is reset, the snapshot is taken for all messages except Announce, Management, and Signaling. For more information about the timestamp snapshots, see [Table 511: Timestamp Snapshot Dependency on ETH_MACTSCR Bits](#).
- Bit 13 **TSIPV4ENA**: Enable Processing of PTP Packets Sent over IPv4-UDP
 When this bit is set, the MAC receiver processes the PTP packets encapsulated in IPv4-UDP packets. When this bit is reset, the MAC ignores the PTP transported over IPv4-UDP packets. This bit is set by default.
- Bit 12 **TSIPV6ENA**: Enable Processing of PTP Packets Sent over IPv6-UDP
 When this bit is set, the MAC receiver processes the PTP packets encapsulated in IPv6-UDP packets. When this bit is clear, the MAC ignores the PTP transported over IPv6-UDP packets.
- Bit 11 **TSIPENA**: Enable Processing of PTP over Ethernet Packets
 When this bit is set, the MAC receiver processes the PTP packets encapsulated directly in the Ethernet packets. When this bit is reset, the MAC ignores the PTP over Ethernet packets.
- Bit 10 **TSVER2ENA**: Enable PTP Packet Processing for Version 2 Format
 When this bit is set, the IEEE 1588 version 2 format is used to process the PTP packets.
 When this bit is reset, the IEEE 1588 version 1 format is used to process the PTP packets.
 The IEEE 1588 formats are described in 'PTP Processing and Control'.
- Bit 9 **TSCTRLSSR**: Timestamp Digital or Binary Rollover Control
 When this bit is set, the Timestamp Low register rolls over after 0x3B9A_C9FF value (that is, 1 nanosecond accuracy) and increments the timestamp (High) seconds. When this bit is reset, the rollover value of subsecond register is 0x7FFF_FFFF. The subsecond increment must be programmed correctly depending on the PTP reference clock frequency and the value of this bit.
- Bit 8 **TSENALL**: Enable Timestamp for All Packets
 When this bit is set, the timestamp snapshot is enabled for all packets received by the MAC.
- Bits 7:6 Reserved, must be kept at reset value.

Bit 5 **TSADDREG**: Update Addend Register

When this bit is set, the content of the Timestamp Addend register is updated in the PTP block for fine correction. This bit is cleared when the update is complete. This bit should be zero before it is set.

Bit 4 Reserved, must be kept at reset value.

Bit 3 **TSUPDT**: Update Timestamp

When this bit is set, the system time is updated (added or subtracted) with the value specified in [System time seconds update register \(ETH_MACSTSUR\)](#) and [System time nanoseconds update register \(ETH_MACSTNUR\)](#).

This bit should be zero before updating it. This bit is reset when the update is complete in hardware.

Bit 2 **TSINIT**: Initialize Timestamp

When this bit is set, the system time is initialized (overwritten) with the value specified in the [System time seconds update register \(ETH_MACSTSUR\)](#) and [System time nanoseconds update register \(ETH_MACSTNUR\)](#).

This bit should be zero before it is updated. This bit is reset when the initialization is complete.

Bit 1 **TSCFUPDT**: Fine or Coarse Timestamp Update

When this bit is set, the Fine method is used to update system timestamp. When this bit is reset, Coarse method is used to update the system timestamp.

Bit 0 **TSENA**: Enable Timestamp

When this bit is set, the timestamp is added for Transmit and Receive packets. When disabled, timestamp is not added for transmit and receive packets and the Timestamp Generator is also suspended. You need to initialize the Timestamp (system time) after enabling this mode.

On the Receive side, the MAC processes the 1588 packets only if this bit is set.

Subsecond increment register (ETH_MACSSIR)

Address offset: 0x0B04

Reset value: 0x0000 0000

In Coarse Update mode (bit TSCFUPDT in [Timestamp control Register \(ETH_MACTSCR\)](#)), the value in this register is added to the system time every clock cycle of `clk_ptp_ref_i`. In Fine Update mode, the value in this register is added to the system time whenever the Accumulator gets an overflow.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SSINC[7:0]

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:16 **SSINC[7:0]**: Subsecond Increment Value

The value programmed in this field is accumulated every clock cycle (of `clk_ptp_i`) with the contents of the subsecond register. For example, when the PTP clock is 50 MHz (period is 20 ns), you should program 20 (0x14) when the System Time Nanoseconds register has an accuracy of 1 ns [TSCTRLSSR bit is set in [Timestamp control Register \(ETH_MACTSCR\)](#)]. When TSCTRLSSR is cleared, the Nanoseconds register has a resolution of ~0.465 ns. In this case, you should program a value of 43 (0x2B) which is derived by $20 \text{ ns} / 0.465$.

Bits 15:0 Reserved, must be kept at reset value.

System time seconds register (ETH_MACSTSR)

Address offset: 0x0B08

Reset value: 0x0000 0000

The System Time Seconds register, along with System Time Nanoseconds register, indicates the current value of the system time maintained by the MAC. Though it is updated on a continuous basis, there is some delay from the actual time because of clock domain transfer latencies (from clk_ptp_ref_i to CSR clock).

r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bit 31 Reserved, must be kept at reset value.

Bits 30:0 **TSSS[30:0]**: Timestamp subseconds

The value in this field has the subsecond representation of time, with an accuracy of 0.46 ns. When TSCTRLSSR is set in [Timestamp control Register \(ETH_MACTSCR\)](#), each bit represents 1 ns. The maximum value is 0x3B9A_C9FF after which it rolls-over to zero.

System time seconds update register (ETH_MACSTSUR)

Address offset: 0x0B10

Reset value: 0x0000 0000

The System Time Seconds Update register, along with the System Time Nanoseconds update register, initializes or updates the system time maintained by the MAC. You must write both registers before setting the TSINIT or TSUPDT bits in *Timestamp control Register (ETH_MACTSCR)*.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
TSS[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TSS[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **TSS[31:0]**: Timestamp Seconds

The value in this field is the seconds part of the update.

When ADDSUB is reset, this field must be programmed with the seconds part of the update value.

When ADDSUB is set, this field must be programmed with the complement of the seconds part of the update value.

For example, to subtract 2.000000001 seconds from the system time, the TSS field in the ETH_MACSTSUR register must be 0xFFFF_FFFE (that is, $2^{32} - 2$).

Caution: When the ADDSUB bit is set, TSS[30:0] field cannot be set to 0 in *System time nanoseconds update register (ETH_MACSTNUR)*. The TSS bitfield must be programmed to 0x7FFF_FFFF (resulting in -0.46 ns) even if 0 ns must be subtracted.

For example, to subtract 2.000000000 seconds from the system time, the TSS field in the *System time seconds update register (ETH_MACSTSUR)* must be 0xFFFF_FFFE (that is, $2^{32} - 1$) and the *System time nanoseconds update register (ETH_MACSTNUR)* must be 0xFFFF_FFFF (ADDSUB = 1 and TSS[30:0] field = 0x7FFF_FFFF)

System time nanoseconds update register (ETH_MACSTNUR)

Address offset: 0x0B14

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
ADD SUB	TSS[30:16]														
	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TSS[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 **ADDSUB**: Add or Subtract Time

When this bit is set, the time value is subtracted with the contents of the update register.
 When this bit is reset, the time value is added with the contents of the update register.

Bits 30:0 **TSSS[30:0]**: Timestamp subseconds

The value in this field is the subseconds part of the update.

- ADDSUB is 1: This field must be programmed with the complement of the subseconds part of the update value as described.
- ADDSUB is 0: This field must be programmed with the subseconds part of the update value, with an accuracy based on the TSCTRLSSR bit of the *Timestamp control Register (ETH_MACTSCR)*.
- TSCTRLSSR field in the *Timestamp control Register (ETH_MACTSCR)* is 1:
 - The programmed value must be $10^9 - \text{<subsecond value>}$.
 - Each bit represents 1 ns and the programmed value should not exceed 0x3B9A_C9FF.
- TSCTRLSSR field in the *Timestamp control Register (ETH_MACTSCR)* is 0:
 - The programmed value must be $2^{31} - \text{<subsecond_value>}$.
 - Each bit represents an accuracy of 0.46 ns.

For example, to subtract 2.000000001 seconds from the system time, then the TSSS field in the ETH_MACSTNUR register must be 0x7FFF_FFFF (that is, $2^{31} - 1$), when TSCTRLSSR bit in *Timestamp control Register (ETH_MACTSCR)* is reset and 0x3B9A_C9FF (that is, $10^9 - 1$), when TSCTRLSSR bit in *Timestamp control Register (ETH_MACTSCR)* is set.

Caution: When the ADDSUB bit is set, TSSS[30:0] field cannot be set to 0. The TSSS bitfield must be programmed to 0x7FFF FFFF (resulting in -0.46 ns) even if 0 ns must be subtracted.

For example, to subtract 2.000000000 seconds from the system time, *System time nanoseconds update register (ETH_MACSTNUR)* must be 0xFFFF FFFF (ADDSUB = 1 and TSSS[30:0] = 0) and the TSS field in the *System time seconds update register (ETH_MACSTSUR)* must be 0xFFFF FFFE (that is, $2^{32} - 1$).

Timestamp addend register (ETH_MACTSAR)

Address offset: 0x0B18

Reset value: 0x0000 0000

This register value is used only when the system time is configured for Fine Update mode (TSCFUPDT bit in the *Timestamp control Register (ETH_MACTSCR)*). The content of this register is added to a 32-bit accumulator in every clock cycle of clk_ptp_ref_i and the system time is updated whenever the accumulator overflows.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
TSAR[31:16]

TSAR[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **TSAR[31:0]**: Timestamp Addend Register

This field indicates the 32-bit time value to be added to the Accumulator register to achieve time synchronization.

Timestamp status register (ETH_MACTSSR)

Address offset: 0x0B20

Reset value: 0x0000 0000

All bits except Bits[27:25] gets cleared when the application reads this register.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	ATSNS[4:0]				ATSS TM	Res.	Res.	Res.	Res.	ATSSTN[3:0]

rc_r												rc_r	rc_r	rc_r	rc_r

Bits 31:30 Reserved, must be kept at reset value.

Bits 29:25 **ATSNS[4:0]**: Number of Auxiliary Timestamp Snapshots

This field indicates the number of Snapshots available in the FIFO. A value equal to the depth of FIFO (4) indicates that the Auxiliary Snapshot FIFO is full. These bits are cleared (to 00000) when the Auxiliary snapshot FIFO clear bit is set.

Bit 24 **ATSSTM**: Auxiliary Timestamp Snapshot Trigger Missed

This bit is set when the Auxiliary timestamp snapshot FIFO is full and external trigger was set. This indicates that the latest snapshot is not stored in the FIFO.

Bits 23:20 Reserved, must be kept at reset value.

Bits 19:16 **ATSSTN[3:0]**: Auxiliary Timestamp Snapshot Trigger Identifier

These bits identify the Auxiliary trigger inputs for which the timestamp available in the Auxiliary Snapshot Register is applicable. When more than one bit is set at the same time, it means that corresponding auxiliary triggers were sampled at the same clock. These bits are applicable only if the number of Auxiliary snapshots is more than one. One bit is assigned for each trigger as shown in the following list:

- Bit 16: Auxiliary trigger 0
- Bit 17: Auxiliary trigger 1
- Bit 18: Auxiliary trigger 2
- Bit 19: Auxiliary trigger 3

The software can read this register to find the triggers that are set when the timestamp is taken.

Bit 15 **TXTSSIS**: Tx Timestamp Status Interrupt Status

When drop transmit status is enabled in MTL, this bit is set when the captured transmit timestamp is updated in the *Tx timestamp status nanoseconds register (ETH_MACTXTSSNR)* and *Tx timestamp status seconds register (ETH_MACTXTSSSR)*.

When PTP offload feature is enabled, this bit is set when the captured transmit timestamp is updated in the *Tx timestamp status nanoseconds register (ETH_MACTXTSSNR)* and *Tx timestamp status seconds register (ETH_MACTXTSSSR)*, for PTO generated Delay Request and Pdelay request packets.

This bit is cleared when the *Tx timestamp status seconds register (ETH_MACTXTSSSR)* is read (or write of 1 when RCWE bit in *CSR software control register (ETH_MACCSRWC)* is set).

Bits 14:4 Reserved, must be kept at reset value.

- Bit 3 **TSTRGTERR0**: Timestamp Target Time Error
 This bit is set when the latest target time programmed in the *PPS target time seconds register (ETH_MACPPSTTSR)* and *PPS target time nanoseconds register (ETH_MACPPSTTNR)* elapses. This bit is cleared when the application reads this bit (or write of 1 when RCWE bit in *CSR software control register (ETH_MACCSRSWCR)* is set).
- Bit 2 **AUXSTRIG**: Auxiliary Timestamp Trigger Snapshot
 This bit is set high when the auxiliary snapshot is written to the FIFO.
 This bit is cleared when the application reads this bit (or write of 1 when RCWE bit in *CSR software control register (ETH_MACCSRSWCR)* is set).
- Bit 1 **TSTARGET0**: Timestamp Target Time Reached
 When set, this bit indicates that the value of system time is greater than or equal to the value specified in the *PPS target time seconds register (ETH_MACPPSTTSR)* and *PPS target time nanoseconds register (ETH_MACPPSTTNR)*.
 This bit is cleared when the application reads this bit (or write of 1 when RCWE bit in *CSR software control register (ETH_MACCSRSWCR)* is set).
- Bit 0 **TSSOVF**: Timestamp Seconds Overflow
 When this bit is set, it indicates that the seconds value of the timestamp (when supporting version 2 format) has overflowed beyond 32'hFFFF_FFFF.
 This bit is cleared when the application reads this bit (or write of 1 when RCWE bit in *CSR software control register (ETH_MACCSRSWCR)* is set).

Tx timestamp status nanoseconds register (ETH_MACTXTSSNR)

Address offset: 0x0B30

Reset value: 0x0000 0000

This register contains the nanosecond part of timestamp captured for Transmit packets when Tx status is disabled.

	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

- Bit 31 **TXTSSMIS**: Transmit Timestamp Status Missed
 When this bit is set, it indicates one of the following:
 - The timestamp of the current packet is ignored if TXTSSTSM bit of the *Timestamp control Register (ETH_MACTSCR)* is reset
 - The timestamp of the previous packet is overwritten with timestamp of the current packet if TXTSSTSM bit of the *Timestamp control Register (ETH_MACTSCR)* is set.

Bits 30:0 **TXTSSLO[30:0]**: Transmit Timestamp Status Low
 This field contains the 31 bits of the Nanoseconds field of the Transmit packet's captured timestamp.

Tx timestamp status seconds register (ETH_MACTXTSSSR)

Address offset: 0x0B34

Reset value: 0x0000 0000

The register contains the higher 32 bits of the timestamp (in seconds) captured when a PTP packet is transmitted.

Bits 31:0 **TXTSSHI[31:0]**: Transmit Timestamp Status High

This field contains the lower 32 bits of the Seconds field of Transmit packet's captured timestamp.

Auxiliary control register (ETH_MACACR)

Address offset: 0x0B40

Reset value: 0x0000 0000

The Auxiliary Timestamp Control register controls the Auxiliary Timestamp snapshot.

								r/w	r/w	r/w	r/w				r/w

Bits 31:8 Reserved, must be kept at reset value.

Bit 7 **ATSEN3**: Auxiliary Snapshot 3 Enable

- This bit controls the capturing of Auxiliary Snapshot Trigger 3. When this bit is set, the auxiliary snapshot of the event on eth_ptp_trg3 input is enabled. When this bit is reset, the events on this input are ignored.

Bit 6 **ATSEN2**: Auxiliary Snapshot 2 Enable

- This bit controls the capturing of Auxiliary Snapshot Trigger 2. When this bit is set, the auxiliary snapshot of the event on eth_ptp_trg2 input is enabled. When this bit is reset, the events on this input are ignored.

Bit 5 **ATSEN1**: Auxiliary Snapshot 1 Enable

- This bit controls the capturing of Auxiliary Snapshot Trigger 1. When this bit is set, the auxiliary snapshot of the event on eth_ptp_trg1 input is enabled. When this bit is reset, the events on this input are ignored.

Bit 4 **ATSEN0**: Auxiliary Snapshot 0 Enable

This bit controls the capturing of Auxiliary Snapshot Trigger 0. When this bit is set, the auxiliary snapshot of the event on eth_ptp_trg0 input is enabled. When this bit is reset, the events on this input are ignored.

Bits 3:1 Reserved, must be kept at reset value.

Bit 0 **ATSFC**: Auxiliary Snapshot FIFO Clear

When set, this bit resets the pointers of the Auxiliary Snapshot FIFO. This bit is cleared when the pointers are reset and the FIFO is empty. When this bit is high, the auxiliary snapshots are stored in the FIFO.

Auxiliary timestamp nanoseconds register (ETH_MACATSNR)

Address offset: 0x0B48

Reset value: 0x0000 0000

The *Auxiliary timestamp nanoseconds register (ETH_MACATSNR)*, along with *Auxiliary timestamp seconds register (ETH_MACATSSR)*, gives the 64-bit timestamp stored as auxiliary snapshot. These two registers form the read port of a 64-bit wide FIFO with a depth of 4 words.

You can store multiple snapshots in this FIFO. Bits[29:25] in *Timestamp status register (ETH_MACTSSR)* indicate the fill-level of the FIFO. The top of the FIFO is removed only when *Auxiliary timestamp seconds register (ETH_MACATSSR)* is read.

Bit 31 Reserved, must be kept at reset value.

Bits 30:0 **AUXTSLO[30:0]**: Auxiliary Timestamp

Contains the lower 31 bits (nanoseconds field) of the auxiliary timestamp.

Auxiliary timestamp seconds register (ETH_MACATSSR)

Address offset: 0x0B4C

Reset value: 0x0000 0000

The Auxiliary Timestamp Seconds register contains the lower 32 bits of the Seconds field of the auxiliary timestamp register.

Bits 31:0 **AUXTSHI[31:0]**: Auxiliary Timestamp

Contains the lower 32 bits of the Seconds field of the auxiliary timestamp.

Timestamp Ingress asymmetric correction register (ETH_MACTSIACR)

Address offset: 0x0B50

Reset value: 0x0000 0000

The MAC Timestamp Ingress Asymmetry Correction register contains the Ingress Asymmetry Correction value to be used while updating correction field in PDelay_Resp PTP messages.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

OSTIAC[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **OSTIAC[31:0]**: One-Step Timestamp Ingress Asymmetry Correction

This field contains the ingress path asymmetry value to be added to correctionField of Pdelay_Resp PTP packet. The programmed value should be in units of nanoseconds and multiplied by 2¹⁶. For example, 2.5 ns is represented as 0x00028000.

The value can also be negative, which is represented in 2's complement form with bit 31 representing the sign bit.

Timestamp Egress asymmetric correction register (ETH_MACTSEACR)

Address offset: 0x0B54

Reset value: 0x0000 0000

The MAC Timestamp Egress Asymmetry Correction register contains the Egress Asymmetry Correction value to be used while updating the correction field in PDelay_Req PTP messages.

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **OSTEAC[31:0]**: One-Step Timestamp Egress Asymmetry Correction

This field contains the egress path asymmetry value to be subtracted from correctionField of Pdelay_Resp PTP packet. The programmed value must be the negated value in units of nanoseconds multiplied by 2¹⁶.

For example, if the required correction is +2.5 ns, the programmed value must be 0xFFFFD_8000, which is the 2's complement of 0x0002_8000(2.5 * 2¹⁶). Similarly, if the required correction is -3.3 ns, the programmed value is 0x0003_4CCC (3.3 * 2¹⁶).

Timestamp Ingress correction nanosecond register (ETH_MACTSICNR)

Address offset: 0x0B58

Reset value: 0x0000 0000

This register contains the correction value in nanoseconds to be used with the captured timestamp value in the ingress path.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bits 31:0 **T SIC[31:0]**: Timestamp Ingress Correction

This field contains the ingress path correction value as defined by the Ingress Correction expression.

Timestamp Egress correction nanosecond register (ETH_MACTSECNR)

Address offset: 0x0B5C

Reset value: 0x0000 0000

This register contains the correction value in nanoseconds to be used with the captured timestamp value in the egress path.

Bits 31:0 **T SEC[31:0]**: Timestamp Egress Correction

This field contains the nanoseconds part of the egress path correction value as defined by the Egress Correction expression.

PPS control register (ETH_MACPPSCR)

Address offset: 0x0B70

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TRGTMODSELO [1:0]	PPSEN 0	PPSCTRL[3:0]				
									r w	r w	r w	r w	r w	r w	r w

Bits 31:7 Reserved, must be kept at reset value.

Bits 6:5 **TRGTMODSEL0[1:0]**: Target Time Register Mode for PPS Output

This field indicates the Target Time registers (*PPS target time seconds register (ETH_MACPPSTTSR)* and *PPS target time nanoseconds register (ETH_MACPPSTTNR)*) mode for PPS output signal:

00: Target Time registers are programmed only for generating the interrupt event.

01: Reserved, must not be used

10: Target Time registers are programmed for generating the interrupt event and starting or stopping the PPS output signal generation.

11: Target Time registers are programmed only for starting or stopping the PPS output signal generation. No interrupt is asserted.

Bit 4 **PPSENO**: Flexible PPS Output Mode Enable

When this bit is set, PPSCCTRL[3:0] function as PPSCMD[3:0]. When this bit is reset, PPSCCTRL[3:0] function as PPSCCTRL (Fixed PPS mode).

Bits 3:0 **PPSCTRL[3:0]**: PPS Output Frequency Control

This field controls the frequency of the PPS output (*eth_ptp_pps_out*) signal. The default value of PPSCTRL is 0000, and the PPS output is 1 pulse (of width *clk_ptp_i*) every second. For other values of PPSCTRL, the PPS output becomes a generated clock of following frequencies:

0001: The binary rollover is 2 Hz, and the digital rollover is 1 Hz.

0010: The binary rollover is 4 Hz, and the digital rollover is 2 Hz.

0011: The binary rollover is 8 Hz, and the digital rollover is 4 Hz.

0100: The binary rollover is 16 Hz, and the digital rollover is 8 Hz.

..

1111: The binary rollover is 32.768 KHz and the digital rollover is 16.384 KHz.

Note: In the binary rollover mode, the PPS output (eth_ptp_pps_out) has a duty cycle of 50 percent with these frequencies. In the digital rollover mode, the PPS output frequency is an average number. The actual clock is of different frequency that gets synchronized every second. For example:

- *When PPSCTRL = 0001, the PPS (1 Hz) has a low period of 537 ms and a high period of 463 ms*
- *When PPSCTRL = 0010, the PPS (2 Hz) is a sequence of One clock of 50 percent duty cycle and 537 ms period
Second clock of 463 ms period (268 ms low and 195 ms high)*
- *When PPSCTRL = 0011, the PPS (4 Hz) is a sequence of Three clocks of 50 percent duty cycle and 268 ms period
Fourth clock of 195 ms period (134 ms low and 61 ms high)*

This behavior is because of the non-linear toggling of bits in the digital rollover mode in the ETH_MACSTNR register.

PPS control register [alternate] (ETH_MACPPSCR)

Address offset: 0x0B70

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

										r/w	r/w	r/w	r/w	r/w	r/w

Bits 31:7 Reserved, must be kept at reset value.

- Bits 6:5 **TRGTMODSEL0[1:0]**: Target Time Register Mode for PPS Output
This field indicates the Target Time registers (MAC registers 96 and 97) mode for PPS output signal:
00: Target Time registers are programmed only for generating the interrupt event.
01: Reserved, must not be used
10: Target Time registers are programmed for generating the interrupt event and starting or stopping the PPS output signal generation.
11: Target Time registers are programmed only for starting or stopping the PPS output signal generation. No interrupt is asserted.
- Bit 4 **PPSEN0**: Flexible PPS Output Mode Enable
When this bit is set, Bits[3:0] function as PPSCMD[3:0]. When this bit is reset, Bits[3:0] function as PPSCTRL (Fixed PPS mode).
- Bits 3:0 **PPSCMD[3:0]**: Flexible PPS Output (eth_ptp_pps_out) Control
Programming these bits with a non-zero value instructs the MAC to initiate an event. When the command is transferred or synchronized to the PTP clock domain, these bits get cleared automatically. The software should ensure that these bits are programmed only when they are 'all zero'. The following list describes the values of PPSCMD0:
- 0000: No Command
0001: START Single Pulse.
This command generates single pulse rising at the start point defined in Target Time Registers (register 455 and 456) and of a duration defined in the PPS Width Register.
0010: START Pulse Train.
This command generates the train of pulses rising at the start point defined in the Target Time Registers and of a duration defined in the PPS Width Register and repeated at interval defined in the PPS Interval Register. By default, the PPS pulse train is free-running unless stopped by the 'Stop Pulse train at time' or 'Stop Pulse Train immediately' commands.
0011: Cancel START.
This command cancels the START Single Pulse and START Pulse Train commands if the system time has not crossed the programmed start time.
0100: STOP Pulse Train at time.
This command stops the train of pulses initiated by the START Pulse Train command (PPSCMD[3:0] = 0010) after the time programmed in the Target Time registers elapses.
0101: STOP Pulse Train immediately.
This command immediately stops the train of pulses initiated by the START Pulse Train command (PPSCMD[3:0] = 0010).
0110: Cancel STOP Pulse train.
This command cancels the STOP pulse train at time command if the programmed stop time has not elapsed. The PPS pulse train becomes free-running on the successful execution of this command.
0111 to 1111: Reserved, must not be used

PPS target time seconds register (ETH_MACPPSTTSR)

Address offset: 0x0B80

Reset value: 0x0000 0000

The PPS Target Time Seconds register, along with [PPS target time nanoseconds register \(ETH_MACPPSTTNR\)](#), is used to schedule an interrupt event [Bit TSSOVF of [Timestamp status register \(ETH_MACTSSR\)](#)] when the system time exceeds the value programmed in these registers.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
TSTRH0[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TSTRH0[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **TSTRH0[31:0]**: PPS Target Time Seconds Register

This field stores the time in seconds. When the timestamp value matches or exceeds both Target Timestamp registers, the MAC starts or stops the PPS signal output and generates an interrupt (if enabled) based on Target Time mode selected for the corresponding PPS output in the [PPS control register \(ETH_MACPPSCR\)](#).

PPS target time nanoseconds register (ETH_MACPPSTTNR)

Address offset: 0x0B84

Reset value: 0x0000 0000

The PPS Target Time Nanoseconds register is present only when more than one Flexible PPS output is selected.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
TRGTB USY0	TTSL0[30:16]														
	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TTSL0[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 **TRGTBUSY0**: PPS Target Time Register Busy

The MAC sets this bit when the PPSCMD0 field in the *PPS control register (ETH_MACPPSCR)* is programmed to 010 or 011. Programming the PPSCMD0 field to 010 or 011 instructs the MAC to synchronize the Target Time Registers to the PTP clock domain. The MAC clears this bit after synchronizing the Target Time Registers with the PTP clock domain. The application must not update the Target Time Registers when this bit is read as 1. Otherwise, the synchronization of the previous programmed time gets corrupted.

Bits 30:0 **TTSL0[30:0]**: Target Time Low for PPS Register

This register stores the time in (signed) nanoseconds. When the value of the timestamp matches the value in both Target Timestamp registers, the MAC starts or stops the PPS signal output and generates an interrupt (if enabled) based on the TRGTMODSEL0 field (Bits [6:5]) in *PPS control register (ETH_MACPPSCR)*.

When the TSCTRLSSR bit is set in the *Timestamp control Register (ETH_MACTSCR)*, this value should not exceed 0x3B9A_C9FF. The actual start or stop time of the PPS signal output may have an error margin up to one unit of subsecond increment value.

PPS interval register (ETH_MACPPSIR)

Address offset: 0x0B88

Reset value: 0x0000 0000

The PPS Interval register contains the number of units of subsecond increment value between the rising edges of PPS signal output (eth_ptp_pps_out).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
PPSINT0[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
PPSINT0[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **PPSINT0[31:0]**: PPS Output Signal Interval

These bits store the interval between the rising edges of PPS signal output. The interval is stored in terms of number of units of subsecond increment value.

You need to program one value less than the required interval. For example, if the PTP reference clock is 50 MHz (period of 20 ns), and desired interval between the rising edges of PPS signal output is 100 ns (that is, 5 units of subsecond increment value), you should program value 4 (5-1) in this register.

PPS width register (ETH_MACPPSWR)

Address offset: 0x0B8C

Reset value: 0x0000 0000

The PPS Width register contains the number of units of subsecond increment value between the rising and corresponding falling edges of PPS signal output (eth_ptp_pps_out).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
PPSWIDTH0[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
PPSWIDTH0[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **PPSWIDTH0[31:0]**: PPS Output Signal Width

These bits store the width between the rising edge and corresponding falling edge of PPS signal output. The width is stored in terms of number of units of subsecond increment value. You need to program one value less than the required interval. For example, if PTP reference clock is 50 MHz (period of 20 ns), and width between the rising and corresponding falling edges of PPS signal output is 80 ns (that is, four units of subsecond increment value), you should program value 3 (4-1) in this register.

Note: The value programmed in this register must be lesser than the value programmed in PPS interval register (ETH_MACPPSIR).

PTP Offload control register (ETH_MACPOCR)

Address offset: 0x0BC0

Reset value: 0x0000 0000

This register controls the PTP Offload Engine operation.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res	Res	Res	Res	Res	Res	Res	Res	Res	Res	Res	Res	Res	Res	Res	Res

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:8 **DN[7:0]**: Domain Number

This field indicates the domain Number in which the PTP node is operating.

Bit 7 Reserved, must be kept at reset value.

Bit 6 **DRRDIS**: Disable PTO Delay Request/Response response generation

When this bit is set, the Delay Request and Delay response are not generated for received SYNC and Delay request packet respectively, as required by the programmed mode.

- Bit 5 **APDREQTRIG**: Automatic PTP Pdelay_Req message Trigger
 When this bit is set, one PTP Pdelay_Req message is transmitted. This bit is automatically cleared after the PTP Pdelay_Req message is transmitted. The application should set the APDREQEN bit for this operation.
- Bit 4 **ASYNCTRIG**: Automatic PTP SYNC message Trigger
 When this bit is set, one PTP SYNC message is transmitted. This bit is automatically cleared after the PTP SYNC message is transmitted. The application should set the ASYNCEN bit for this operation.
- Bit 3 Reserved, must be kept at reset value.
- Bit 2 **APDREQEN**: Automatic PTP Pdelay_Req message Enable
 When this bit is set, PTP Pdelay_Req message is generated periodically based on interval programmed or trigger from application, when the MAC is programmed to be in Peer-to-Peer Transparent mode.
- Bit 1 **ASYNCEN**: Automatic PTP SYNC message Enable
 When this bit is set, PTP SYNC message is generated periodically based on interval programmed or trigger from application, when the MAC is programmed to be in Clock Master mode.
- Bit 0 **PTOEN**: PTP Offload Enable
 When this bit is set, the PTP Offload feature is enabled.

PTP Source Port Identity 0 Register (ETH_MACSPI0R)

Address offset: 0x0BC4

Reset value: 0x0000 0000

This register contains Bits[31:0] of the 80-bit Source Port Identity of the PTP node.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

- Bits 31:0 **SPI0[31:0]**: Source Port Identity 0
 This field indicates bits [31:0] of sourcePortIdentity of PTP node.

PTP Source port identity 1 register (ETH_MACSPI1R)

Address offset: 0x0BC8

Reset value: 0x0000 0000

This register contains Bits[63:32] of the 80-bit Source Port Identity of the PTP node.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

SPI1[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **SPI1[31:0]**: Source Port Identity 1

This field indicates bits [63:32] of sourcePortIdentity of PTP node.

PTP Source port identity 2 register (ETH_MACSPI2R)

Address offset: 0x0BCC

Reset value: 0x0000 0000

This register contains Bits[79:64] of the 80-bit Source Port Identity of the PTP node.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res	Res	Res	Res	Res	Res	Res	Res	Res	Res	Res	Res	Res	Res	Res	Res

SPI2[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **SPI2[15:0]**: Source Port Identity 2

This field indicates bits [79:64] of sourcePortIdentity of PTP node.

Log message interval register (ETH_MACLMIR)

Address offset: 0x0BD0

Reset value: 0x0000 0000

This register contains the periodic intervals for automatic PTP packet generation.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
LMPDRI[7:0]								Res	Res	Res	Res	Res	Res	Res	Res
rw	rw	rw	rw	rw	rw	rw	rw								
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res	Res	Res	Res	Res	DRSYNCR[2:0]			LSI[7:0]							
					rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:24 **LMPDRI[7:0]**: Log Min Pdelay_Req Interval

This field indicates logMinPdelayReqInterval of PTP node. This is used to schedule the periodic Pdelay request packet transmission. Allowed values are -15 to 15. Negative value must be represented in 2's-complement form. For example, if the required value is -1, the value programmed must be 0xFF.

Bits 23:11 Reserved, must be kept at reset value.

Bits 10:8 **DRSYNCR[2:0]**:

Delay_Req to SYNC Ratio

In Slave mode, it is used for controlling frequency of Delay_Req messages transmitted.

0: DelayReq generated for every received SYNC

1: DelayReq generated every alternate reception of SYNC

2: for every 4 SYNC messages

3: for every 8 SYNC messages

4: for every 16 SYNC messages

5: for every 32 SYNC messages

Others: Reserved, must not be used

The master sends this information (logMinDelayReqInterval) in the DelayResp PTP messages to the slave. The reception processes this value from the received DelayResp messages and updates this field accordingly. In the Slave mode, the host must not write/update this register unless it has to override the received value. In Master mode, the sum of this field and logSyncInterval (LSI) field is provided in the logMinDelayReqInterval field of the generated multicast Delay_Resp PTP message.

Bits 7:0 **LSI[7:0]**:

Log Sync Interval

This field indicates the periodicity of the automatically generated SYNC message when the PTP node is Master. Allowed values are -15 to 15. Negative value must be represented in 2's-complement form. For example, if the required value is -1, the value programmed must be 0xFF.

65 Hardware debug port (HDP)

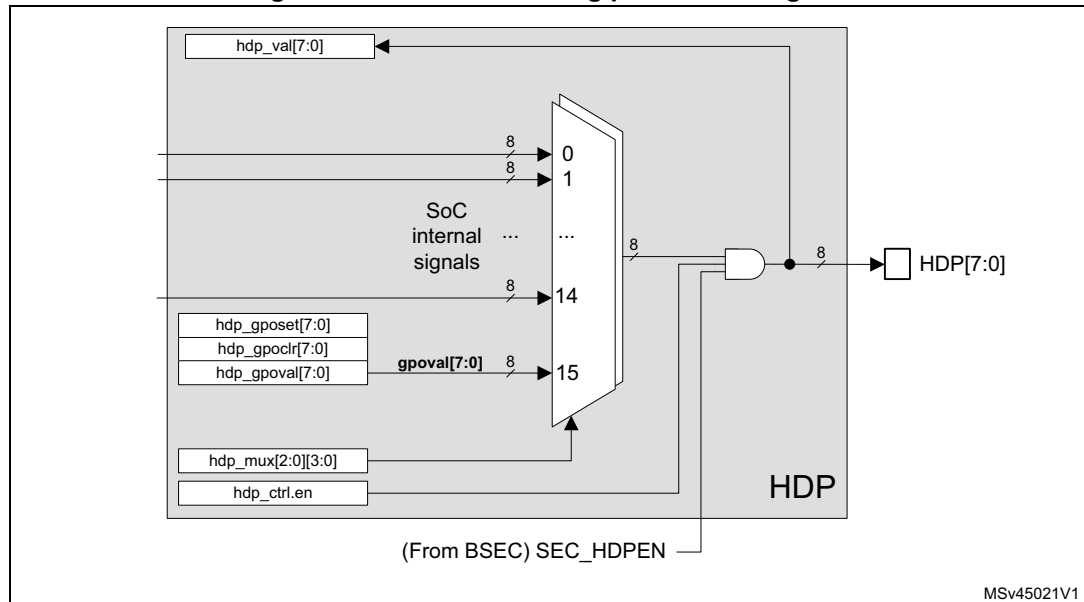

The Hardware Debug Port allows the observation of internal signals. By using multiplexers, up to 16 signals for each of 8-bit output can be observed.

65.1 Features

- 8 output signals
- One of 15 internal signals with individual control
- 8 Software programmable signals for pinout agnostic code debugging
- Output disabling by security signal

65.2 Block diagram

Figure 818. Hardware debug port block diagram

65.3 Functional description

The main multiplexer, allowing the selection of the 8-signal debug set to be output, is controlled through the HDP_CTRL register.

The HDP value at the output of the main multiplexer can be read by software through the HDP_VAL register.

During debug it is often useful to output some signals that are controlled by software; these can be used to observe a precise code sequence or to indicate the current executed task. Debug set #15 is reserved for this purpose; it provides on HDP outputs the value of the HDP_GPOVAL register. This register is associated with set and clear registers (HDP_GPOSET and HDP_GPOCLR) allowing the signals to be toggled without a read-modify-write sequence.

Some debug sets expose internal data that require protection; the SEC_HDPEN signal, when low, forces all the HDP block outputs low.

Note: The internal signals may toggle at a higher rate than the pads can support, in which case their observability may be compromised. The user should be aware of this limitation when using the HDP port.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	HDPGPOSET[7:0]							
								w	w	w	w	w	w	w	w

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **HDPGPOSET[7:0]**: HDP general purpose output set

When a bit is written to 1, the corresponding HDP GPO is set. Writing a bit to 0 has no effect.

65.4.5 HDP general purpose output clear register (HDP_GPOCLR)

Address offset: 0x018

Reset value: 0xFFFF XXXX

HDP GPO clear

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	HDPGPOCLR[7:0]							
								w	w	w	w	w	w	w	w

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **HDPGPOCLR[7:0]**: HDP general purpose output clear

When a bit is written to 1, the corresponding HDP GPO is cleared. Writing a bit to 0 has no effect.

65.4.6 HDP general purpose output value register (HDP_GPOVAL)

Address offset: 0x01C

Reset value: 0x0000 0000

HDP GPO value

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

66 Debug support (DBG)

66.1 Introduction

A comprehensive set of debug features is provided to support software development and system integration:

- Independent breakpoint debugging of each CPU core in the system
- Code execution tracing
- Software instrumentation
- Cross-triggering
- The debug features can be controlled via a JTAG/Serial-wire debug access port, using industry standard debugging tools. A trace port allows data to be captured for logging and analysis.

The debug features are based on Arm[®] CoreSight[™] components:

- SWJ-DP: JTAG/Serial-wire debug port
- AXI-AP: AXI access port
- AHB-AP: AHB access port
- APB-AP: APB access port
- ITM: Instrumentation Trace Macrocell
- DWT: Data Watchpoint and Trace
- ETM: Embedded Trace Macrocell
- ETF: Embedded Trace FIFO
- TPIU: Trace Port Interface Unit
- SWO: Serial Wire Output
- CTI: Cross Trigger Interface
- CTM: Cross Trigger Matrix
- Timestamp Generator
- STM: System Trace Macrocell

These components are described in [Section 66.10](#) to [Section 66.12](#). More information can be found in the Arm[®] documents referenced in [Section 66.13](#).

66.2 Debug use cases

The trace and debug system has been designed to support a variety of typical use cases:

- **Low cost software trace (Cortex[®]-M4 only)**
Limited trace capability is available over the single-wire debug output. This supports code instrumentation using “printf”, tracing of data and address watchpoints, interrupt detection and program counter sampling.
- **External debugging of each core independently**
All processor cores can be simultaneously and independently debugged using equipment connected to the JTAG/SWD debug port. This allows breakpoint and watchpoint setting, code stepping, memory access etc.
- **Self-hosted debugging of each core independently**
All processor cores can be simultaneously and independently debugged by software running on one of the cores. This allows breakpoint and watchpoint setting, code stepping, memory access etc.
- **Synchronous debugging of both cores**
When one core stops due to a breakpoint or a debugger stop command, the other core can be stopped as well. Similarly, the cores can be restarted at the same time. This allows debugging of loosely coupled applications which require the processors to remain synchronized.
- **Tracing code execution from one or more cores via the trace port**
Trace information from all cores is combined into a single trace stream and output to a trace port analyser in real time. An ID embedded in the trace allows the analyzer to identify the source of each information packet.
- **Code and hardware instrumentation via the trace port**
Software “printf” data from the processors, memory content via DMA, and hardware event trace information can be generated using the system trace macrocell. The information is combined with the processor trace stream and output to a trace port analyzer in real time.
- **Capturing trace continuously in a circular buffer**
Instead of streaming it off-chip, the combined trace information can be stored on-chip in a circular buffer. The trace storage can be started and stopped by a debugger command, a software command, an external trigger signal, an internal event, etc.
- **Draining the buffer to the trace port**
The stored trace can be dumped off-chip to the trace port analyzer. The buffer draining can be initiated by the debugger, software, external trigger, internal event etc.
- **Reading the buffer with the debugger**
The debugger can read the contents of the trace buffer via the debug port. This is slower than the trace port, but allows basic trace functionality on the debugger without the cost of a trace port analyzer.
- **Self-hosted trace analysis**
The trace buffer can be read by any of the processor cores, or transferred into system memory by DMA. This powerful feature allows built-in test software to perform real-time

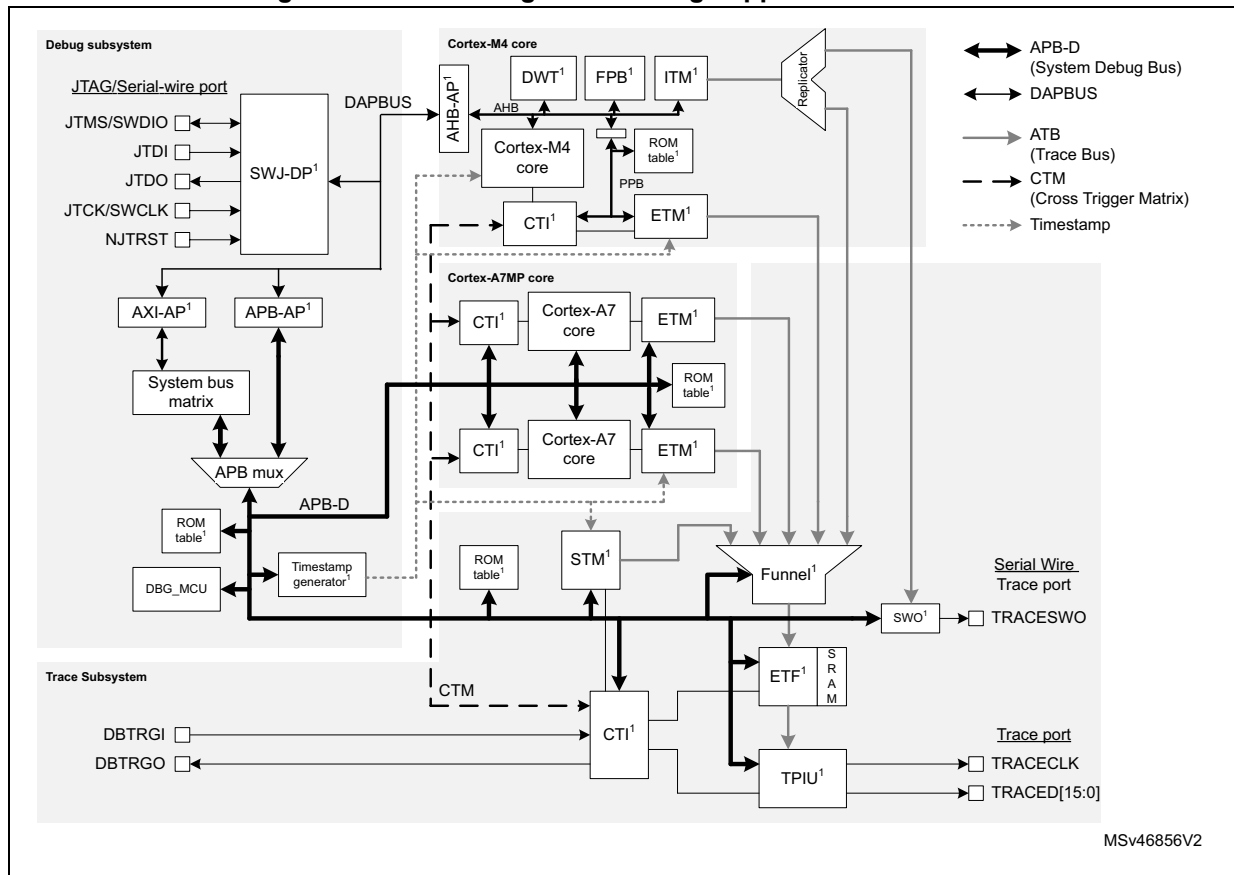

code execution monitoring, fault analysis and identification, autonomous exception handling, and others.

- Uploading stored trace

The stored trace can also be uploaded to a host machine using one of the MPU's many communications interfaces (such as USB, USART, SPI, I2C, Ethernet, CAN, and others). This is especially useful if the trace port is not accessible, for example remote monitoring and failure analysis of a deployed product.

Pin name	JTAG debug port		SW debug port		Pin assignment
	Type	Description	Type	Description	
JTMS/SWDIO	I	JTAG test mode select	I/O	Serial wire data in/out	Refer to datasheet
JTCK/SWCLK	I	JTAG test clock	I	Serial wire clock	
JTDI	I	JTAG test data input	-	-	
JTDO	O	JTAG test data output	-	-	
NJTRST	I	JTAG test reset	-	-	

Table 563. Trace port pins

Pin name	Type	Description	Pin assignment
TRACED[15:0]	O	Trace synchronous data out (can be 1, 2, 4, 8 or 16 pins)	Refer to datasheet
TRACECLK	O	Trace clock	

Table 564. Serial Wire Trace port pins

Pin name	Type	Description	Pin assignment
TRACESWO	O	Trace asynchronous data out	Refer to datasheet ⁽¹⁾

- TRACESWO is multiplexed with JTDO. This means that single wire trace is only available when using the serial wire debug interface, not when using JTAG

Table 565. Trigger pins

Pin name	Type	Description	Pin assignment
DBTRGI	I	External trigger input to CTI	Refer to datasheet
DBTRGO	O	External trigger output from CTI	
DBTRGIO	I/O	External Trigger Bi-directional ⁽¹⁾	

- DBTRGIO can be configured as an input or an output by the TRGOEN bit in the DBGMCU_CR register. If configured as an input, it is connected to DBTRGI. If an output, it is connected to DBTRGO. This is because DBTRGI and DBTRGO are not available on certain packages.

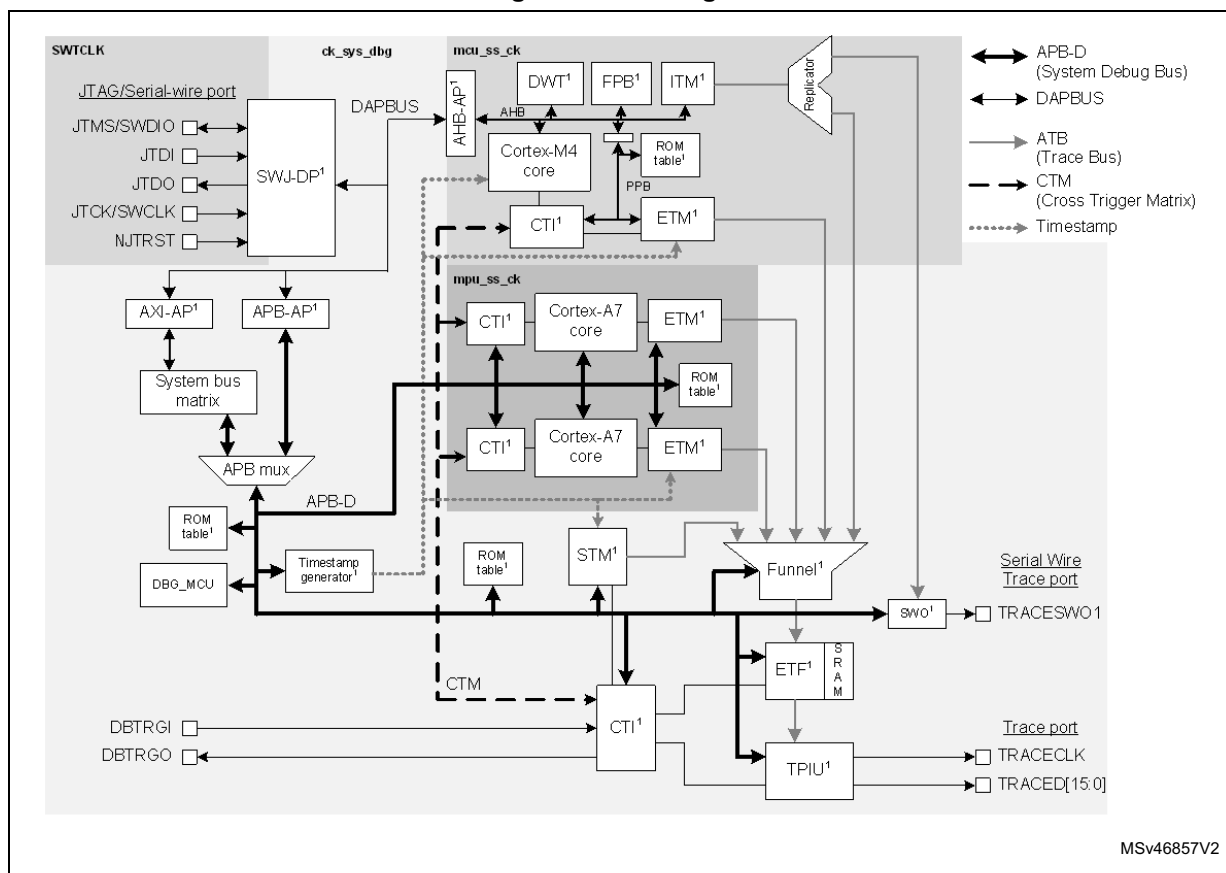

66.5 DBG power and clocking

66.5.1 DBG power domains

All debug components including the SWJ-DP are in the core power domain. This means that the debugger is not able to wake the device from Standby mode.

66.5.2 DBG clocks

Figure 820. Debug clock domains

1. Arm® CoreSight™ component

The debugger supplies the clock for the debug port, SWTCLK, via the debug interface pin, JTCK/SWCLK. This clock is used to register the serial input data in both serial wire and JTAG mode, as well as to operate the state machines and internal logic of the debug port. It must therefore continue to toggle for several cycles after the end of an access, to ensure that the debug port returns to the idle state.

The SWJ-DP contains an asynchronous interface to the system debug clock domain, ck_sys_dbg. The remainder of the debug subsystem, as well as the trace subsystem, is in this domain. ck_sys_dbg is a gated version of the AXI bus clock, ack.

The clock is enabled by the debugger using the CDBGPWRUPREQ bit in the debug port CTRL/STAT register. It can also be enabled by software writing bit DBGCKEN in RCC debug configuration register (RCC_DBGCFGR). The clock must be enabled before the debugger or software can access any of the debug features on the device. It should be disabled when debug and trace are not used to avoid wasting energy.

The APB-D (debug APB bus) clock (ck_apb_dbg) runs at half of the ck_sys_dbg frequency. Some of the CoreSight™ components on this bus operate at the APB-D frequency, notably the timestamp generator (TSGEN).

The trace port (TPIU) output clock, ck_trace, is generated using TRACEDIV programmable divider in RCC debug configuration register (RCC_DBGCFGR). Its maximum frequency is

half that of `ck_sys_dbg`. The `trace_ck` signal is output on the TRACECLK GPIO pin when it is configured for trace function. The same clock is used to drive the serial wire output (SWO).

Note: TRACECLK is enabled by setting TRACECKEN to 1 in RCC debug configuration register (RCC_DBGCFGR). It should be activated whenever tracing is required, even if neither the TPIU nor the SWO are active (that is when using the embedded trace FIFO as a software buffer). This is to avoid filling up the SWO FIFO which would then block the trace output from the ITM in the Cortex[®]-M4.

The debug and trace components included in the processors (ETM, ITM, DWG, FPB, CTI etc) are clocked with the corresponding core clock (`mpu_ss_ck` for the Cortex[®]-A7 subsystem, `mcu_ss` for the Cortex[®]-M4 subsystem).

66.5.3 Debug and low-power modes

The STM32MP157 device includes power saving features which allow the various domain clocks and even the core power to be switched off when not required. If the core power is switched off (Standby mode), or the system debug domain is not clocked (Stop mode), all debug components will be inaccessible to the debugger. To avoid this, power saving mode emulation has been implemented. If emulation is enabled, the device still enters the programmed low power mode, but its clock and power are maintained. In other words, the domain behaves as if it is in low power mode, but the debugger does not lose the connection.

Emulation mode is programmed in the MCU Debug (DBGMCU) unit. For more information, refer to [Section 66.10.8](#).

If the device is in Stop mode (ie. all clocks off) without emulation and the debugger wishes to wake the system up, it can do so by asserting the CDBGPWRUPREQ bit in the debug port CTRL/STAT register. This restarts the clocks (and switches on the high power regulator if needed) but does not generate any interrupt or event to either processor core. When the wake-up has completed, the CDBGPWRUPACK bit in the same register will go high. In this state the debugger can access the memories and peripheral registers, and trigger a wakeup of the CPUs if required.

66.5.4 DBG reset

The debug components, except for the debug port, are reset by their respective clock domain resets. The debug port (SWJ-DP) is reset by the `nTRST` or `vcore_rst` resets. The access ports can be reset under debugger control, using the CDBGRSTREQ/ACK bits in the CTRL/STAT register of the debug port.

The debugger sets the CDBGRSTREQ bit to request a reset. It then polls the CDBGRSTACK bit until it goes high, indicating that the reset has completed, following which it deasserts the CDBGRSTREQ bit.

66.6 Security

The trace and debug components allow a high degree of access to the processor and system during product development. In order to protect user code and ensure that the debug features can not be used to alter or compromise the normal operation of the finished product, these features can be disabled, or limited in scope. For example, secure software debug and trace can be disabled without preventing the debug of non-secure code.

66.6.1 Authentication signals

There are six authentication signals used by the system to determine what features are enabled or disabled. These signals controlled in the BSEC debug configuration (BSEC_DENABLE) are:

- **deviceen**: controls access to debug components via the external debug port.
0: external debugger has no access to debug components. Debugger access to system interconnect is not affected.
1: external debugger has access to debug components
- **dbgen**: global enable for all debug and trace features
0: all debug features are disabled. External and software access to debug components is still possible. External access to system interconnect is disabled.
1: debug features in non-secure mode are enabled. External access to non-secure system interconnect is enabled. Debug features in secure mode and external access to secure system interconnect are dependent on the state of the **spiden** signal.
- **spiden**: enables debug in secure privileged mode when **dbgen** = 1
0: debug features are disabled in secure privileged mode. External access to secure system interconnect is disabled.
1: debug features are enabled in secure privileged mode. External access to secure system interconnect is enabled.
- **niden**: enables trace and performance monitoring (non-invasive debug)
0: trace generation is disabled.
1: trace generation in non-secure mode is enabled. Trace generation in secure privileged mode is dependent on the state of the **spniden** signal.
- **spniden**: enables trace and performance monitoring in secure privileged mode when **niden** = 1.
0: trace generation is disabled in secure privileged mode.
1: trace generation is enabled in secure privileged mode.
- **dbgswenable**: enables self-hosted debug
0: software access to all debug components is disabled
1: software access to all debug components is enabled

Table 566 lists which signals are connected to which debug and trace components.

Table 566. Authentication signal connectivity

	deviceen	dbgen	spiden	niden	spniden	dbgswenable
Debug APB-AP	X	-	-	-	-	X
Cortex [®] -M4 AHB-AP	X ⁽¹⁾	X	-	-	-	-
System bus AXI-AP	-	X	X	-	-	-
Cortex [®] -M4 DWT/FPB/SCS/ITM	-	X	-	-	-	-
Cortex [®] -M4 ETM	-	-	-	X	-	-
Cortex [®] -M4 CTI	-	X	-	X	-	-
Cortex [®] -A7 MPCore Debug unit	-	X	X	X	X	X
Cortex [®] -A7 MPCore ETM	-	X	-	X	-	-

Table 566. Authentication signal connectivity (continued)

	deviceen	dbgen	spiden	niden	spniden	dbgswenable
Cortex [®] -A7 MPCore CTI	-	X	-	X	-	-
STM	-	X	X	X	X	-

1. **deviceen** connects to DAPEN in the Cortex[®]-M4

For detailed information on the behavior of each component according to the state of the authentication signals, refer to the relevant component chapter, or to the relevant Arm[®] technical documentation.

The initial state of the signals are set at power-on reset, according to [Table 567](#). The state of the signals can be modified in the BSEC debug configuration (BSEC_DENABLE) register after boot-up by software with secure privileged access rights.

Table 567. Authentication signal initial states

Device state (set by OTP fuse)	Authentication signal default state	Description
Development device	All ones	All debug and trace is enabled at boot-up.
Production device	All zeros	All debug and trace is disabled at boot-up. Secure software should enable debug as required after booting.

66.7 Chip level TAP controller (CLTAPC)

The JTAG interface is connected to the internal scan chain of the IC. It is used for testing as well as for debug. The first component in the scan chain is the Chip Level TAP Controller which implements a TAP state machine based on IEEE Std 1149.1-1990. It allows access to the built-in manufacturing test features.

The CLTAPC must be bypassed in order to access the debug support functions provided by the SWJ-DP. This is done by prefixing the SWJ-DP instructions with the CLTAPC bypass instruction sequence: 11111.

The CLTAPC also contains three 16-bit registers which can be accessed using the CTRL instruction sequence: 01000, followed by 1111 to bypass the SWJ-DP. Next, the register address is shifted into the DR (LSB first). Finally, the 16-bit register content is shifted into or out of the DR, according to whether the register is read or write.

The CLTAPC registers are listed in [Table 568](#).

Table 568. CLTAPC registers

Name	Address	Description	Read/Write
SECSTS	001	Status of the BSEC_DENABLE register	R
DBGCTL	010	Connected to BSEC_JTAGIN register	W
DBGSTS	011	Connected to BSEC_JTAGOUT register	R

For details of the BSEC register bits, refer to [Section 3: Boot and security and OTP control \(BSEC\)](#).

66.8 Serial wire and JTAG debug port (SWJ-DP)

The SWJ-DP is a CoreSight™ component that implements an external access port for connecting debugging equipment.

Two types of interface can be configured:

- A 5-pin standard JTAG interface (JTAG-DP)
- A 2-pin (clock + data) “serial-wire debug” port (SW-DP)

The two modes are mutually exclusive, since they share the same I/O pins.

By default the JTAG-DP is selected after a system or power-on reset. The five I/O pins are configured by hardware in debug alternative function mode. The SWJ-DP incorporates pull-up resistors on JTDI, JTMS/SWDIO, and NJTRST, as well as a pull-down resistor on JTCK/SWCLK.

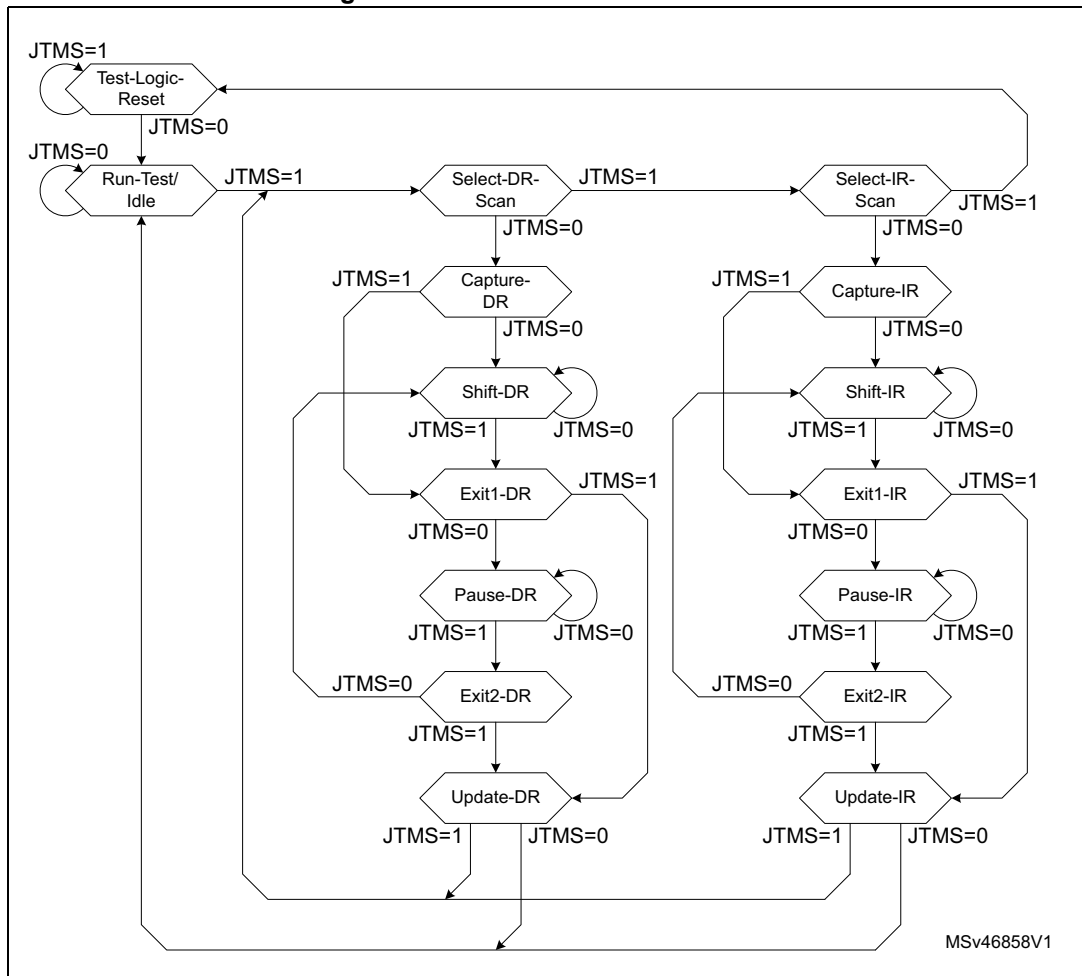

A debugger can select the SW-DP by transmitting the following serial data sequence on JTMS/SWDIO:

...(50 or more ones)...,0,1,1,1,1,0,0,1,1,1,1,0,0,1,1,1,...(50 or more ones)...

JTCK/SWCLK must be cycled for each data bit.

66.8.1 JTAG debug port

Figure 821. JTAG TAP state machine

The JTAG-DP implements a TAP state machine (TAPSM) based on IEEE Std 1149.1-1990. The state machine is shown in [Figure 821](#). The state machine controls two scan chains, one associated with an instruction register (IR) and one with a number of data registers (DR).

The operation of the JTAG-DP is as follows:

When the TAPSM goes through the Capture-IR state, 0001 is transferred onto the Instruction Register (IR) scan chain. The IR scan chain is connected between JTDI and JTDO.

While the TAPSM is in the Shift-IR state, the IR scan chain shifts one bit for each rising edge of JTCK. This means that on the first tick:

- The LSB of the IR scan chain is output on JTDO.
- Bit[n] of the IR scan chain is transferred to bit[n-1].
- The value on JTDI is transferred to the MSB of the IR scan chain.

When the TAPSM goes through the Update-IR state, the value scanned into the IR scan chain is transferred into the Instruction Register.

When the TAPSM goes through the Capture-DR state, a value is transferred from one of the Data Registers onto one of the DR scan chains, connected between JTDI and JTDO.

The value held in the Instruction Register determines which Data Register, and associated DR scan chain, is selected.

This data is then shifted while the TAPSM is in the Shift-DR state, in the same manner as the IR shift in the Shift-IR state.

When the TAPSM goes through the Update-DR state, the value scanned into the DR scan chain is transferred into the selected Data Register.

When the TAPSM is in the Run-Test/Idle state, no special actions occur. The IDCODE instruction is loaded in IR.

The NJTRST signal when active resets the state machine asynchronously to the Test-Logic-Reset state.

The Data registers corresponding to the 4-bit IR instructions are listed in [Table 569](#).

Table 569. JTAG-DP data registers

IR instruction	DR register	Scan chain length	Description
0000 to 0111	(BYPASS)	1	Not implemented: BYPASS selected
1000	ABORT	35	ABORT register - Bits 31:1 = Reserved - Bit 0 = APABORT: write 1 to generate a AP abort.
1001	(BYPASS)	1	Reserved: BYPASS selected

Table 569. JTAG-DP data registers (continued)

IR instruction	DR register	Scan chain length	Description
1010	DPACC	35	<p>Debug port access register</p> <p>Initiates the debug port and allows access to a debug port register.</p> <p>– When transferring data IN: Bits 34:3 = DATA[31:0] = 32-bit data to transfer for a write request Bits 2:1 = A[3:2] = 2-bit address of a debug port register. 1011	APACC	35	<p>Access port access register</p> <p>Initiates an access port and allows access to an access port register.</p> <p>– When transferring data IN: Bits 34:3 = DATA[31:0] = 32-bit data to shift in for a write request Bits 2:1 = A[3:2] = 2-bit sub-address of an access port register. Bit 0 = RnW= Read request (1) or write request (0).</p> <p>– When transferring data OUT: Bits 34:3 = DATA[31:0] = 32-bit data which is read following a read request Bits 2:0 = ACK[2:0] = 3-bit Acknowledge: 010 = OK/FAULT 001 = WAIT Others = Reserved</p>
1100	(BYPASS)	1	Reserved: BYPASS selected
1101	(BYPASS)	1	Reserved: BYPASS selected
1110	IDCODE	32	<p>ID Code</p> <p>0x6BA0 0477: Arm® JTAG debug port ID code</p>
1111	BYPASS	1	<p>Bypass</p> <p>A single JTCK cycle delay is inserted between JTDI and JTDO</p>

The DR registers are described in more detail in the *Arm® Debug Interface Architecture Specification [1]*.

66.8.2 Serial Wire debug port

The Serial Wire Debug protocol uses the two pins:

- SWCLK: clock from host to target
- SWDIO: bi-directional serial data (100 kOhm pull-up required)

Serial data is transferred LSB first, synchronously with the clock. A transfer comprises three phases:

1. Packet request (8 bits) transmitted by the host
2. Acknowledge response (3 bits) transmitted by the target.
3. Data transfer (33 bits) transmitted by the host (in the case of a write) or target (in the case of a read).

The data transfer only occurs if the acknowledge response is OK.

Between each phase, if the direction of the data is reversed, a single clock cycle turn-around time is inserted.

Table 570. Packet request

Bit field	Name	Description
0	Start	Must be 1
1	APnDP	0: DP register access - see Table 573 for a list of DP registers 1: AP register access - see Section 66.9
2	RnW	0: write request 1: read request
4:3	A(3:2)	Address field of the DP or AP register (refer to Table 573)
5	Parity	Single bit parity of preceding bits
6	Stop	0
7	Park	Not driven by host. Must be read as 1 by target.

Table 571. ACK response

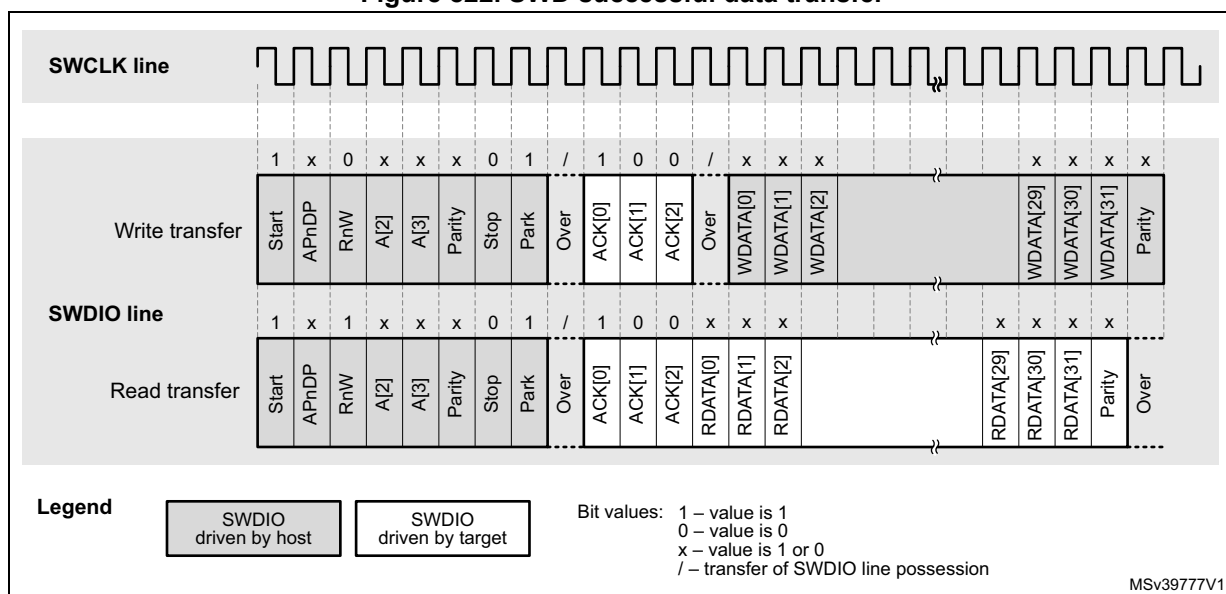

Bit field	Name	Description
2:0	ACK	000: FAULT 010: WAIT 100: OK

Table 572. Data transfer

Bit field	Name	Description
31:0	WDATA or RDATA	Write or read data
32	Parity	Single bit parity of 32 data bits

[Figure 822](#) shows examples of successful write and read transfers.

Figure 822. SWD successful data transfer

In the case of a FAULT or WAIT ACK response from the target, the data transfer phase is cancelled, unless overrun detection is enabled, in which case the data will be ignored by the target (in the case of a write), or not driven (in the case of a read).

A line reset must be generated by the host when it is first connected, or following a protocol error. The line reset consists of 50 or more SWCLK cycles with SWDIO high, followed by two SWCLK cycles with SWDIO low.

For more details on the Serial Wire debug protocol, refer to the *Arm® Debug Interface Architecture Specification [1]*.

Note: The SWJ-DP implements SWD protocol version 2

66.8.3 Debug port registers

The SW-DP and JTAG-DP both access the debug port (DP) registers. These are listed in [Table 573](#).

The debugger can access the DP registers as follows:

1. Program the DPBANKSEL field in the DP_SELECT data port register to select the register bank to be accessed (see [Table 573](#)).
2. Program the A(3:2) field in the DPACC register, if using JTAG, with the register address within the bank.
3. Program the RnW bit to select a Read or Write.
4. In the case of a write, program the DATA field with the write data.

If using SWD, the A(3:2) and RnW fields are part of the Packet Request word sent to the SW-DP with the APnDP bit reset (see [Table 570](#)). The write data is sent in the data phase.

Table 573. Debug port registers

Address	A(3:2) value	R/W	Description
0x0	00	R	DP_DPIDR register. Contains the IDCODE for the debug port
		W	DP_ABORT register ⁽¹⁾ . Aborts the current AP transaction. This register is also used to clear the error flags in the DP_CTRLSTAT register.
0x4	01	R/W	If field DPBANKSEL of register DP_SELECT is 0: DP_CTRLSTAT register. Controls the DP and provides status information.
			If field DPBANKSEL of register DP_SELECT is 1: DP_DLCR register ⁽²⁾ . Controls the operating mode of the SWD data link.
			If field DPBANKSEL of register DP_SELECT is 2: DP_TARGETID register. Provides target identification information.
			If field DPBANKSEL of register DP_SELECT is 3: DP_DLPIDR register ⁽³⁾ . Provides the SWD protocol version.
0x8	10	R	DP_RESEND register ⁽⁴⁾ . Returns the value that was returned by the last AP read or DP RDBUFF read. Used in the event of a corrupted read transfer.
		W	DP_SELECT register. Selects the access port, access port register bank, and DP register at address 0x4.
0xC	11	R	DP_RDBUFF register: Via JTAG-DP - Used to allow the debugger to get the final result after a sequence of operations (without requesting new JTAG-DP operation) Via SW-DP - Contains the result of the preceding AP read access, allowing a new AP access to be avoided.
		W	DP_TARGETSEL register ⁽⁵⁾ . On a write to DP_TARGETSEL immediately following a line reset sequence, the target is selected if both the following conditions are met: Bits [31:28] match bits [31:28] in the DP_DLPIDR. Bits [27:0] match bits [27:0] in the DP_TARGETID register. Writing any other value de-selects the target. Debug tools must write 0xFFFF FFFF to de-select all targets. This is an invalid TARGETID value. All other invalid TARGETID values are reserved.

1. Access to the AP DP_ABORT register from the JTAG-DP is done using the ABORT instruction.
2. Only accessible via SW-DP. Register is "Reserved" via JTAG-DP.
3. Only accessible via SW-DP. Register is "Reserved" via JTAG-DP.
4. Only accessible via SW-DP. Register is "Reserved" via JTAG-DP.
5. Only accessible via SW-DP. Register is "Reserved" via JTAG-DP.

DP debug port identification register (DP_DPIDR)

Address offset: 0x0

rw	rw	rw	rw	rw	rw	rw	rw	r	r	rw	rw	rw	rw	rw	rw

- Bits 31:30 Reserved, must be kept at reset value.
- Bit 29 **CDBGPWRUPACK**: debug power up acknowledge
Status of the debug domain power up acknowledge signal from the power controller.
0: domain powered down
1: domain powered up
- Bit 28 **CDBGPWRUPREQ**: debug power up request
Controls the debug domain power up request signal to the power controller.
0: request power down
1: request power up
- Bit 27 **CDBGRSTACK**: debug reset acknowledge
Status of the debug domain reset acknowledge signal from the reset controller.
0: domain reset inactive/pending
1: domain reset complete
- Bit 26 **CDBGRSTREQ**: debug reset request
Controls the debug domain reset request signal to the reset controller.
0: de-assert reset request/request inactive
1: assert reset request/request active
- Bits 25:24 Reserved, must be kept at reset value.
- Bits 23:12 **TRNCNT[11:0]**: transaction counter
To program a sequence of transactions to incremental addresses via an AP, TRNCNT is loaded with the number of transactions to perform. It is decremented at the successful completion of each transaction.
- Bits 11:8 **MASKLANE[3:0]**: lane comparison mask
Indicates the bytes to be masked in pushed-compare and pushed-verify operations (when bit TRNMODE of register DP_CTRLSTAT is 1 or 2). In the pushed operations, the word supplied in an AP write transaction is compared with the current value at the target AP address.
1XXX: includes byte lane 3 in comparisons
X1XX: includes byte lane 2 in comparisons
XX1X: includes byte lane 1 in comparisons
XXX1: includes byte lane 0 in comparisons
- Bit 7 **WDATAERR**: write data error in SW-DP
Indicates any of the following cases:
– there is a parity or framing error on the data phase of a write
– a write that has been accepted by the DP is then discarded without being submitted to the AP
This bit is reset by writing 1 to the WDERRCLR bit of the DP_ABORT register.
0: no error
1: error has occurred
Note: This bit is reserved in JTAG-DP.
- Bit 6 **READOK**: AP read response in SW-DP
Indicates the response to the last AP read access.
0: read not OK
1: read OK
Note: This bit is reserved in JTAG-DP.

Bit 5 **STICKYERR**: transaction error⁽¹⁾

Indicates that an error occurred in an AP transaction.

0: no error

1: error has occurred

In the SW-DP, this bit is reset by writing 1 to the STKERRCLR bit of the DP_ABORT register.

In the JTAG-DP, this bit is reset by writing a 1 to it.

Bit 4 **STICKYCMP**: compare match⁽¹⁾

Indicates that a match occurred in a pushed operation.

0: match if TRNMODE = 0x1; no match if TRNMODE = 0x2

1: no match if TRNMODE = 0x1; match if TRNMODE = 0x2

In the SW-DP, this bit is reset by writing 1 to the STKCMPCLR bit of the DP_ABORT register.

In the JTAG-DP, this bit is reset by writing a 1 to it.

Bits 3:2 **TRNMODE[1:0]**: transfer mode for AP write operations

For read operations, this field must be set to 0.

0: normal operation. AP transactions are passed directly to the AP.

1: pushed-verify operation. The DP stores the write data and performs a read transaction at the target AP address. The result of the read is compared with the stored data and if they do not match, the STICKYCMP bit is set.

2: pushed-compare operation. The DP stores the write data and performs a read transaction at the target AP address. The result of the read is compared with the stored data and if they match, the STICKYCMP bit is set.

3: reserved

In pushed operation, only the data bytes indicated by the MASKLANE field are included in the compare.

Bit 1 **STICKYORUN**: overrun⁽¹⁾

Indicates that an overrun occurred (new transaction received before previous transaction completed). This bit is only set if the ORUNDETECT bit is set.

0: no overrun

1: overrun occurred

In the SW-DP, this bit is reset by writing 1 to the ORUNERRCLR bit of the DP_ABORT register. In the JTAG-DP, this bit is reset by writing a 1 to it.

Bit 0 **ORUNDETECT**: overrun detection mode enable

0: overrun detection disabled

1: overrun detection enabled. In the event of an overrun, the STICKYORUN bit will be set and subsequent transactions will be blocked until the STICKYORUN bit is cleared.

1. Access type is 'r' in SW-DP and 'rw' in JTAG-DP.

DP data link control register (DP_DLCR)

Address offset: 0x4

Reset value: 0x0000 0040

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	APBANKSEL[3:0]				DPBANKSEL[3:0]			
								w	w	w	w	w	w	w	w

Bits 31:28 **APSEL[3:0]**: access port select

Selects the access port for the next transaction.

0x0: AP0 - System bus access port (AXI-AP)

0x1: AP1 - Debug bus access port (APB-AP)

0x2: AP2 - Cortex[®]-M4 debug access port (AHB-AP)

Bits 27:8 Reserved, must be kept at reset value.

Bits 7:4 **APBANKSEL[3:0]**: AP register bank select

Selects the 4-word register bank on the active AP for the next transaction.

Bits 3:0 **DPBANKSEL[3:0]**: DP register bank select

Selects the register at address 0x4 of the debug port.

0x0: DP_CTRLSTAT register

0x1: DP_DLCR register

0x2: DP_TARGETID register

0x3: DP_DLPIDR register

Others: reserved

DP read buffer register (DP_RDBUFF)

Address offset: 0xC

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TPARTNO[3:0]				TDESIGNER[10:0]											Res.
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	

- Bits 31:28 **TINSTANCE[3:0]**: target instance number
 Defines the instance number for the target device in a multi-drop system. These bits must be written with the same value as field TINSTANCE in register DP_DLPIDR in order to select this device.
- Bits 27:12 **TPARTNO[15:0]**: target part number
 Defines the part number for the target device. These bits must be written with the same value as field TPARTNO in register DP_TARGETID in order to select this device.
- Bits 11:1 **TDESIGNER[10:0]**: target designer JEDEC code
 Defines the JEDEC code for the target device. These bits must be written with the same value as field TDESIGNER in register DP_TARGETID in order to select this device.
- Bit 0 Reserved, must be kept at reset value.

66.9 Access ports

Figure 823. Debug and access port connections

There are three access ports (AP) attached to the DP:

- AP0: System bus access port (AXI-AP). Allows access to the system bus matrix. This gives visibility of all the memory and peripherals accessible via the AXI and AHB interconnects, except those on the system APB debug bus. No CoreSight™ components are accessible via this port.
- AP1: Debug access port (APB-AP). Allows access to the CoreSight™ components on the debug APB bus, including the Cortex®-A7. The DBGMCU is also located on this bus.
- AP2: Cortex®-M4 access port (AHB-AP). Allows access to the debug and trace features integrated in the Cortex®-M4 processor core via its PPB bus.

All three access ports are of type MEM-AP, that is to say the debug and trace component registers are mapped in the address space of the associated debug bus. The AP is seen by the debugger as a set of 32-bit registers organised in banks of four registers each. Some of these registers are used to configure or monitor the AP itself, while others are used to perform a transfer on the bus. The AP registers are listed in [Table 577](#).

The address of the AP registers is composed of

- Bits [7:4]: contents of the DP_SELECT register APBANKSEL field in the DP (refer to [DP access port select register \(DP_SELECT\)](#))
- Bits [3:2]: contents of the A(3:2) field of the APACC data register in the JTAG-DP (see [Table 569](#)) or of the SW-DP Packet Request (see [Table 570](#)), depending on the debug interface used
- Bits [1:0]: Always set to 0

The contents of the DP_SELECT register APSEL field in the DP define which MEM-AP is being accessed.

The debugger can access the AP registers as follows:

1. Program the DP_SELECT register APSEL field in the DP to choose one of the APs, and the APBANKSEL field to select the register bank to be accessed (refer to [DP access port select register \(DP_SELECT\)](#)).
2. Program the A(3:2) field in the APACC register, if using JTAG, with the register address within the bank. Program the RnW bit to select a Read or Write. In the case of a write, program the DATA field with the write data. If using SWD, the A(3:2) and RnW fields are part of the Packet Request word sent to the SW-DP with the APnDP bit set (see [Table 570](#)). The write data is sent in the data phase.

The debugger can access the memory mapped debug component registers through the MEM-AP registers (that is using the above AP register access procedure) as follows:

1. Program the transaction target address in the TAR register.
2. Program the CSW register, if necessary, with the transfer parameters (AddrInc for example).
3. Write to or read from the DRW register to initiate a bus transaction at the address held in the TAR register. Alternatively, a read or write to Banked Data register BDn will trigger an access to address TAR[31:4] + n (this allows up to four consecutive addresses to be accessed without changing the address in the TAR register).

For more detailed information on the MEM-AP, refer to the *Arm® Debug Interface Architecture Specification [1]*.

66.9.1 Authentication

The effect of the authentication signals for each access port is shown in [Table 574](#) to [Table 576](#).

Table 574. AP0 (system interconnect) authentication behavior

dbggen	spiden	Others	Behavior
0	X	X	All transfers blocked. Any attempt to perform a transfer will result in an error.
1	0		Secure transfers blocked. Any attempt to perform a secure transfer will result in an error. Non-secure transfers are enabled.
1	1		Both non-secure and secure transfers are enabled.

Table 575. AP1 (Debug APB) authentication behavior

deviceen	Others	Behavior
0	X	All transfers blocked.
1		Transfers enabled. Note: access to certain components may return an error depending on the state of the other authentication signals.

Table 576. AP2 (Cortex®-M4) authentication behavior

deviceen ⁽¹⁾	dbggen	Others	Behavior
0	X	X	All transfers blocked. Any attempt to perform a transfer will result in an error.
X	0		All transfers blocked. Any attempt to perform a transfer will result in an error.
1	1		Transfers enabled.

1. deviceen is connected to the DAPEN input of the Cortex®-M4

66.9.2 MEM-AP registers

Table 577. MEM-AP registers

Address	APBANKSEL	A(3:2)	Name	Description
0x00	0x0	0	CSW	Control/Status Word register - Refer to section AP0 control/status word register (AP0_CSW) AP1 control/status word register (AP1_CSW) AP2 control/status word register (AP2_CSW)
0x04	0x0	1	TAR	Transfer Address register - Refer to section AP transfer address register (AP_TAR)
0x08	-	-	-	Reserved
0x0C	0x0	3	DRW	Data Read/Write register - Refer to section AP data read/write register (AP_DRW)
0x10	0x1	0	BD0	Banked Data 0 register - Refer to section AP banked data register 0 (AP_BD0)
0x14	0x1	1	BD1	Banked Data 1 register - Refer to section AP banked data register 1 (AP_BD1)
0x18	0x1	2	BD2	Banked Data 2 register - Refer to section AP banked data register 2 (AP_BD2)
0x1C	0x1	3	BD3	Banked Data 3 register - Refer to section AP banked data register 3 (AP_BD3)
0x20	0x2	0	ACE	ACE barrier transaction register (AXI-AP only) - Refer to section AP ACE barrier transaction register (AP_ACE)
0x24-0xEC	-	-	-	Reserved
0xF0	-	-	-	Reserved
0xF4	0xF	1	CFG	Configuration register (AXI-AP only) - Refer to section AP configuration register (AP_CFG)

Table 577. MEM-AP registers (continued)

Address	APBANKSEL	A(3:2)	Name	Description
0xF8	0xF	2	BASE	Debug Base Address register (RO) - Refer to section AP x base address register (APx_BASE) (x = 0 to 2)
0xFC	0xF	3	IDR	Identification register (RO) - Refer to section AP x identification register (APx_IDR) (x = 0 to 2)

AP0 control/status word register (AP0_CSW)

Address offset: 0x0

Reset value: 0x3080 6042

For a detailed description of each field, refer to the *Arm AMBA protocol specifications for the corresponding bus [10., 11., 12.]*.

AP0 (AXI-AP):

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	PROT[2:0]			CACHE[3:0]				SPISTATUS	Res.	Res.	Res.	Res.	Res.	Res.	Res.
	rw	rw	rw	rw	rw	rw	rw	r							
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	DOMAIN[1:0]		ACEENABLE	MODE[3:0]				TRINPROG	DBGSTATUS	ADDRINC[1:0]		Res.	SIZE[2:0]		
	rw	rw	rw	rw	rw	rw	rw	r	r	rw	rw		rw	rw	rw

Bit 31 Reserved, must be kept at reset value.

Bits 30:28 **PROT[2:0]**: bus transaction protection attributes

This field sets the AxPROT[2:0] protection attributes of the bus transaction.

- XX0: unprivileged
- XX1: privileged
- X0X: secure
- X1X: non-secure
- 0XX: data
- 1XX: instruction

Bits 27:24 **CACHE[3:0]**: bus transaction cache attributes

This field sets the AxCACHE[3:0] cache attributes of the bus transaction.

- XXX0: non-bufferable
- XXX1: bufferable
- XX0X: non-modifiable (non-cacheable)
- XX1X: modifiable (cacheable)
- X0XX: no read-allocate
- X1XX: read-allocate
- 0XXX: no write-allocate
- 1XXX: write-allocate

- Bit 23 **SPISTATUS**: status of **spiden** authentication signal (read only)
This signal determines whether the debugger can access secure memory.
0: secure AXI transfers are blocked
1: secure AXI transfers are allowed
- Bits 22:15 Reserved, must be kept at reset value.
- Bits 14:13 **DOMAIN[1:0]**: shareable transaction attributes
This field defines the shareable attributes for an ACE transaction.
0x0: non-shareable
0x1: shareable, inner domain, includes additional masters
0x2: shareable, outer domain, also includes inner or additional masters
0x3: shareable, system domain, all masters included
- Bit 12 **ACEENABLE**: ACE transactions enable, including barriers
0: disable
1: enable
- Bits 11:8 **MODE[3:0]**: mode of operation
0x0: normal download or upload
0x1: barrier transaction
0x2-0xF: reserved
- Bit 7 **TRINPROG**: transfer in progress (read only)
Indicates if a bus transfer is in progress on the AP.
0: no transfer in progress
1: bus transfer in progress
- Bit 6 **DBGSTATUS**: status of DBGEN authentication signal (read only)
This signal determines whether the AXI bus can be accessed.
0: AXI transactions are blocked
1: AXI transactions are allowed
- Bits 5:4 **ADDRINC[1:0]**: auto-increment and packing mode on RW data access
Only increments if the current transaction completes without an error response and the transaction is not aborted.
Auto address incrementing and packed data transfers are not performed on access to banked data registers 0x10-0x1C. The value of these bits is ignored in these cases.
If increment is enabled, the address wraps at 1-Kbyte address boundaries.
0x0: no auto-increment
0x1: address is incremented by the size in bytes of the transaction (SIZE field)
0x2: packed transfers enabled. A 32-bit AP access gives rise to 1 x 32-bit, 2 x 16-bit or 4 x 8-bit bus transactions corresponding to the programmed transaction size. The data are packed or unpacked accordingly.
0x3: reserved
- Bit 3 Reserved, must be kept at reset value.
- Bits 2:0 **SIZE[2:0]**: size of next memory access transaction
0x0: 8 bits
0x1: 16 bits
0x2: 32 bits
0x3: 64 bits
Others: reserved

AP1 control/status word register (AP1_CSW)

Address offset: 0x0

Reset value: 0x8000 0042

For a detailed description of each field, refer to the *Arm AMBA protocol specifications for the corresponding bus [10.,11.,12.]*.

AP1 (APB-AP):

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
DBGSWENABLE	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

				r/w	r/w	r/w	r/w	r	r	r/w	r/w		r	r	r

Bit 31 **DBGSWENABLE**: software access enable

Defines whether the system debug APB can be accessed by software. This bit is anded with the **dbgswenable** signal from the BSEC.

0: disable software access

1: enable software access if **dbgswenable** signal from BSEC is also high

Bits 30:12 Reserved, must be kept at reset value.

Bits 11:8 **MODE[3:0]**: barrier support enabled

Defines if memory barrier operation is supported.

0x0: not supported

Bit 7 **TRINPROG**: transfer in progress (read only)

Indicates if a bus transfer is in progress on the AP.

0x0: no transfer in progress

0x1: bus transfer in progress

Bit 6 **DEVICEEN**: device enabled (read only)

Defines whether the system debug APB can be accessed by the debugger. This bit reflects the state of the **deviceen** signal from the BSEC.

0x0: APB access disabled. Any attempt to initiate a transaction on the AP will return an error.

0x1: APB access enabled

Bits 5:4 **ADDRINC[1:0]**: auto-increment mode

Defines whether TAR address is automatically incremented after a transaction.

0x0: no auto-increment

0x1: address is incremented by the size in bytes of the transaction (SIZE field)

Others: reserved

Bit 3 Reserved, must be kept at reset value.

Bits 2:0 **SIZE[2:0]**: size of next memory transaction access (read only)

0x2: word (32 bits)

AP2 control/status word register (AP2_CSW)

Address offset: 0x0

Reset value: 0x2300 0040

For a detailed description of each field, refer to the *Arm AMBA protocol specifications for the corresponding bus [10.,11.,12.]*.

AP2 (AHB-AP):

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	MODE[3:0]				TRINPROG	DBGSTATUS	ADDRINC[1:0]		Res.	SIZE[2:0]		
				rw	rw	rw	rw	r	r	rw	rw		r	r	r

Bits 31:30 Reserved, must be kept at reset value.

Bit 29 **MASTERTYPE**: type of master (read only)
 1: debug

Bits 28:26 Reserved, must be kept at reset value.

Bit 25 **HPROT1**: defines the HPROT(1) attribute of the transaction
 0: user access
 1: privileged access

Bits 24:12 Reserved, must be kept at reset value.

Bits 11:8 **MODE[3:0]**: mode of operation
 0x0: Normal download or upload
 0x1-0xF: Reserved

Bit 7 **TRINPROG**: transfer in progress (read only)
 Indicates if a bus transfer is in progress on the AP.
 0x0: no transfer in progress
 0x1: bus transfer in progress

Bit 6 **DBGSTATUS**: status of the DBGEN authentication signal (read only)
 This signal determines whether the AHB bus can be accessed.
 0: AHB transactions are blocked
 1: AHB transactions are allowed

Bits 5:4 **ADDRINC[1:0]**: auto-increment mode

Defines whether address is automatically incremented after a transaction. If increment is enabled, the address wraps at 4- Kbyte address boundaries.

Auto address incrementing and packed data transfers are not performed on access to banked data registers 0x10-0x1C. The value of these bits is ignored in these cases.

0x0: no auto-increment

0x1: address is incremented by the size in bytes of the transaction (SIZE field)

0x2: packed transfers enabled. A 32-bit AP access gives rise to 1 x 32-bit, 2 x 16-bit, or 4 x 8-bit bus transactions corresponding to the programmed transaction size. The data is packed or unpacked accordingly.

0x3: reserved

Bit 3 Reserved, must be kept at reset value.

Bits 2:0 **SIZE[2:0]**: size of next memory access transaction

0x0: byte (8 bits)

0x1: halfword (16 bits)

0x2: word (32 bits)

Others: reserved

AP transfer address register (AP_TAR)

Address offset: 0x04

Reset value: 0x0000 0000

DATA[15:0]															
r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w

Bits 31:0 **DATA[31:0]**: read/write data for current transfer

In write mode, this is the write data value. In read mode, this is the read data value.
 For 64-bit access (AXI-AP only), multiple accesses must be initiated to DRW to make a single AXI access.

Read: the first read of DRW in a sequence initiates a memory access. The first read returns the lower 32 bits of data. Subsequent read access returns the upper 32 bits of data. If a write to the CSW or TAR is initiated before the sequence completes, then the read access is terminated, and read data is no longer available.

Write: the first write to DRW specifies the least significant 32 bits of data to be written. Subsequent write access specifies the most significant 32 bits to be written. If a write to the CSW is initiated before the sequence completes, then the write access is not initiated on the AXI interface.

Combining partial reads and writes in a sequence terminates the earlier access. Also, the latest access is not recognized.
 Any write access to the CSW register, TAR, or to any other register in the AP during a sequence terminates the ongoing access. Also, the current access is not recognized.
 If a write sequence is terminated, then there is no write on the AXI interface.

AP banked data register 0 (AP_BD0)

Address offset: 0x10

Reset value: 0x0000 0000

66.10 System debug features

The system debug features include the following CoreSight™ components:

- System ROM tables
- Global trace timestamp generator (TSGEN)
- System cross trigger interface (CTI)
- Cross trigger matrix (CTM)
- Trace port interface unit (TPIU)
- Trace bus funnel (CSTF)
- Embedded trace FIFO (ETF)
- Serial Wire Output (SWO)

These components are accessible by the debugger via the system APB-AP and its associated APB debug bus. They are also accessible by the Cortex®-A7 and Cortex®-M4 processors.

The MCU debug unit (DBG_MCU) is also accessed via the Debug APB. This non-CoreSight™ component contains registers for configuring the behavior of the device in debug mode.

66.10.1 System ROM tables

There are two ROM tables on the Debug APB bus. The ROM table is a CoreSight™ component that contains the base addresses of the CoreSight™ debug components on the APB bus. These tables allow a debugger to discover the topology of the CoreSight™ system automatically.

The first table points to the CoreSight™ components located in the debug subsystem: SWO, TSG, and the Cortex®-A7 debug components, as well as to the Trace subsystem ROM table on the debug APB. The DBG_MCU is not referenced by the table as it is not a standard CoreSight™ component. The table occupies a 4-Kbyte, 32-bit wide chunk of APB address

space, from 0xE008 0000 to 0xE008 0FFC when accessed by the debugger, and 0x5008 0000 to 0x5008 0FFC when accessed from the system bus.

Table 578. Debug subsystem ROM table

Address offset in ROM table	Component name	Component base address (debugger)	Component base address (system bus)	Component address offset	Size	Data
0x000	Reserved	0xE008 1000	0x5008 1000	0x0 1000	4 Kbyte	0x0000 1002
0x004	Timestamp generator	0xE008 2000	0x5008 2000	0x0 2000	4 Kbyte	0x0000 2003
0x008	SWO	0xE008 3000	0x5008 3000	0x0 3000	4 Kbyte	0x0000 3003
0x00C	Trace Subsystem ROM table	0xE009 0000	0x5009 0000	0x1 0000	4 Kbyte	0x0001 0003
0x010	STM	0xE00A 0000	0x500A 0000	0x1 0000	4 Kbyte	0x0002 0003
0x014	C-A7_1 DBG	0xE00D 0000	0x500D 0000	0x5 0000	4 Kbyte	0x0005 0003
0x018	C-A7_1 PMU	0xE00D 1000	0x500D 1000	0x5 1000	4 Kbyte	0x0005 1003
0x01C	C-A7_2 DBG	0xE00D 2000	0x500D 2000	0x5 2000	4 Kbyte	0x0005 2003
0x020	C-A7_2 PMU	0xE00D 3000	0x500D 3000	0x5 3000	4 Kbyte	0x0005 3003
0x024	C-A7_1 CTI	0xE00D 8000	0x500D 8000	0x5 8000	4 Kbyte	0x0005 8003
0x028	C-A7_2 CTI	0xE00D 9000	0x500D 9000	0x5 9000	4 Kbyte	0x0005 9003
0x02C	C-A7_1 ETM	0xE00D C000	0x500D C000	0x5 C000	4 Kbyte	0x0005 C003
0x030	C-A7_2 ETM	0xE00D D000	0x500D D000	0x5 D000	4 Kbyte	0x0005 D003
0x034	Top of table	-	-	-	-	0x0000 0000
0x038 to 0xFC8	Reserved	-	-	-	-	0x0000 0000
0xFCC to 0xFFC	ROM table registers	-	-	-	-	See Table 580

The second table occupies a 4-Kbyte, 32-bit wide chunk of APB address space, from 0xE009 0000 to 0xE009 0FFC when accessed by the debugger, and 0x5009 0000 to 0x5009 0FFC when accessed from the system bus. It points to the CoreSight™ components located in the trace subsystem.

Table 579. Trace subsystem ROM table

Address offset in ROM table	Component name	Component base address (debugger)	Component base address (system bus)	Component address offset	Size	Entry
0x000	Trace funnel	0xE009 1000	0x5009 1000	0x1000	4 Kbyte	0x0000 1003
0x004	ETF	0xE009 2000	0x5009 2000	0x2000	4 Kbyte	0x0000 2003
0x008	TPIU	0xE009 3000	0x5009 3000	0x3000	4 Kbyte	0x0000 3003
0x00C	Trace CTI	0xE009 4000	0x5009 4000	0x4000	4 Kbyte	0x0000 4003
0x010	Top of table	-	-	-	-	0x0000 0000
0x018 to 0xFC8	Reserved	-	-	-	-	0x0000 0000
0xFCC to 0xFFC	ROM table registers	-	-	-	-	See Table 580

The top of each ROM table contains a number of read only registers, including the standard CoreSight™ component and peripheral identity registers, refer to [Table 580](#).

Each debug component occupies one or more 4-Kbyte blocks of address space. This block of address space is referred to as the Debug Register File for the component.

The component address offset field of a ROM Table entry points to the start of the last 4-Kbyte block of the address space of the component. This block always contains the Component and Peripheral ID Registers for the component, starting at offset 0xFD0 from the start of the block. The 4-Kbyte count field, bits PIDR4[7:4], specifies the number of 4-Kbyte blocks for the component. Therefore, the process for finding the start of the address space for a component is:

1. Read the ROM Table entry for the component, and extract the Address offset for the component. The Address offset is bits [31:12] of the ROM Table entry.
2. Use the Address offset, together with the base address of the ROM Table, to calculate the base address of the component. The component base address is:

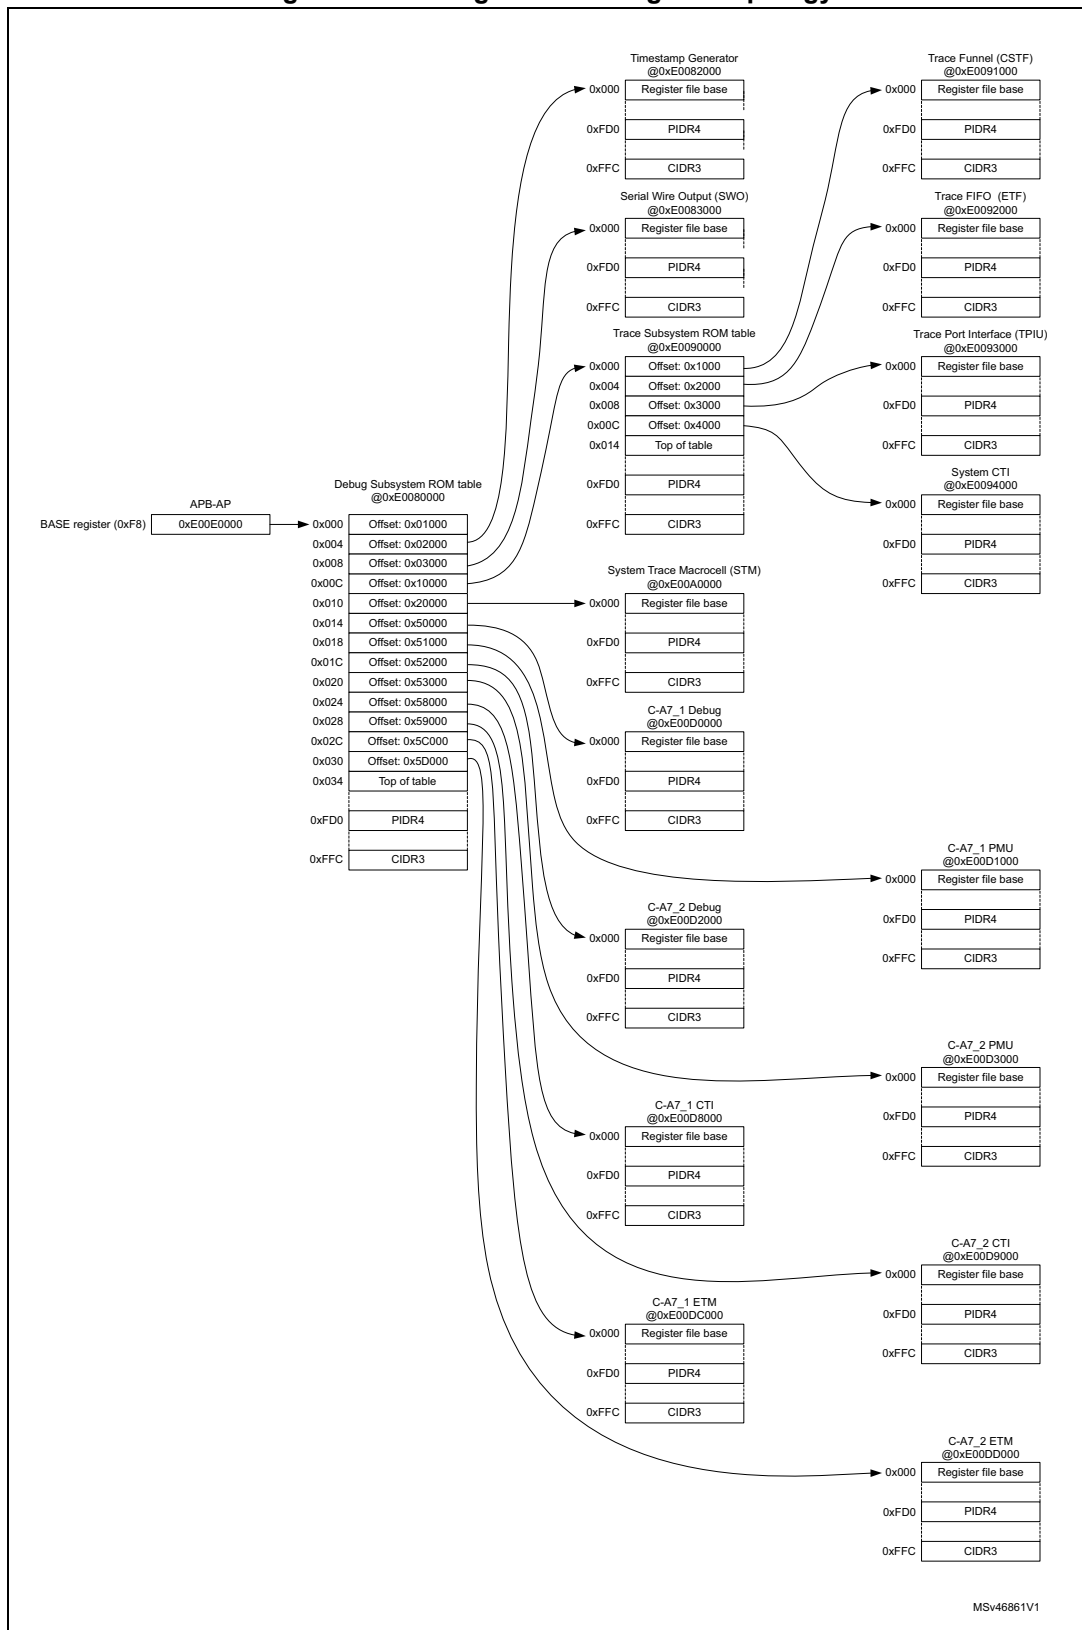

$$\text{Component_Base_Address} = \text{ROM_Base_Address} + (\text{Address_Offset} \ll 12)$$
 Component_Base_Address is the start address of the final 4-Kbyte block of the address space for the component.
3. Read the Peripheral ID4 Register for the component. The address of this register is:

$$\text{Peripheral_ID4_address} = \text{Component_Base_Address} + 0xFD0$$
4. Extract the 4-Kbyte count field, bits [7:4], from the value of the Peripheral ID4 Register.
5. Use the 4-Kbyte count value to calculate the start address of the address space for the component. If the 4-Kbyte count field is 0000, indicating a count value of 1, the address space for the component starts at the Component_Base_Address obtained at stage 2.

The topology for the CoreSight™ components on the debug APB is shown in [Figure 824](#).

For more information on the use of the ROM table, refer to the *Arm® Debug Interface Architecture Specification [1]*.

66.10.2 CoreSight™ global timestamp generator (TSGEN)

The CoreSight™ Global Timestamp Generator contains a 64-bit counter that provides a common timing reference for all of the trace sources in the system, namely the ETM, ITM and STM. These components insert timestamps in the trace streams that allow the trace analyser to recover the chronological order of trace packets, which can be lost when multiple trace sources are multiplexed into one stream at the funnels.

The TSG registers are accessible over the Debug APB. This allows the debugger or debug software to:

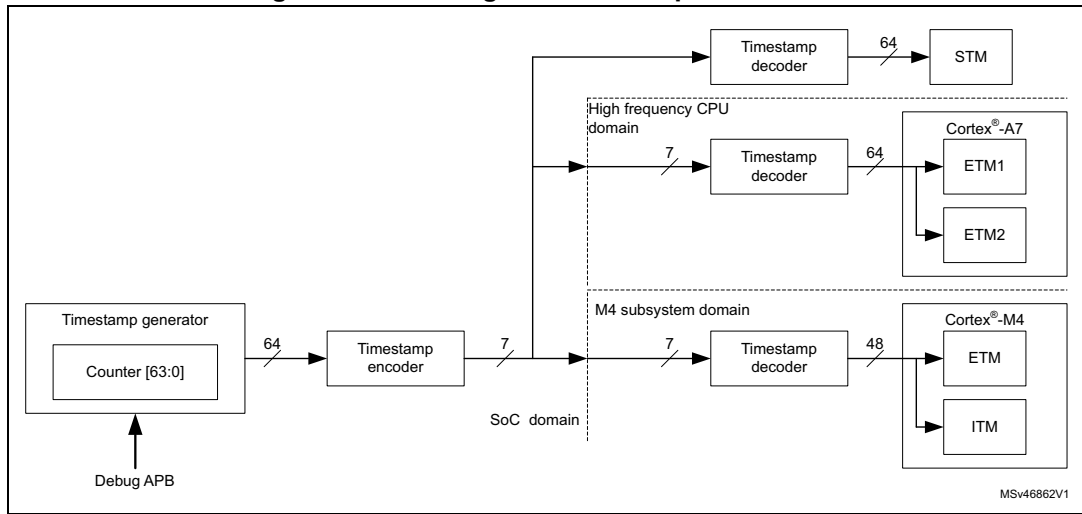

- Start and stop the timestamp incrementing.
- Cause the timestamp counter to stop when debug state is entered. To enable this feature, the trace subsystem CTI must be configured to signal to the timestamp generator when system-wide debug state has been entered (meaning that all CPU cores are halted).
- Read the current timestamp value.
- Change the current timestamp value. The timestamp counter must be halted while it is changed. When the timestamp value is changed, the timestamp generator resynchronizes all the trace sources.
- Change the reported timestamp increment.

For more information on the CoreSight™ Timestamp Generator CoreSight™ component, refer to the *Arm® CoreSight™ SoC-400 Technical Reference Manual [2]*.

The timestamp generator is located in the ck_apb_dbg domain, and the timestamp is distributed to the Cortex®-A7 and Cortex®-M4. To simplify the distribution over clock domain boundaries, the 64-bit timestamp is encoded in 7 bits, then decoded in the destination power domain. The timestamp distribution is shown in *Figure 825*.

Whenever the frequency of the TSGEN, Cortex®-A7 or Cortex®-M4 changes, the ETM of the respective processor receives a pulse on the TSCLKCHANGE input.

Figure 825. CoreSight™ timestamp distribution

Timestamp generator registers

TSG counter control register (TSG_CNTCR)

Address offset: 0x000

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	HDBG	EN
														rw	rw

Bits 31:2 Reserved, must be kept at reset value.

- Bit 1 **HDBG**: halt on debug
 - 0: normal operation
 - 1: halts counter when system-wide debug state is detected (via CTI)
- Bit 0 **EN**: enable
 - 0: counter disabled
 - 1: counter enabled and incrementing

TSG counter status register (TSG_CNTSR)

Address offset: 0x004

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DBGH	Res.
														r	

Bits 31:2 Reserved, must be kept at reset value.

- Bit 1 **DBGH**: debug halted
 - 0: normal operation
 - 1: counter halted due to system-wide debug state
- Bit 0 Reserved, must be kept at reset value.

TSG current counter value lower register (TSG_CNTCVL)

Address offset: 0x008

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
CNTCVU_L_32[31:16]															
r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CNTCVU_L_32[15:0]															
r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w

Bits 31:0 **CNTCVU_L_32[31:0]**: timestamp counter current value (least significant 32 bits)
 To change the current timestamp value, write the least significant 32 bits of the new value to this register before writing the most significant 32 bits to TSG_CNTCVU. The timestamp value is not changed until the TSG_CNTCVU register is written to.
Note: Bit EN of register TSG_CNTCR must be cleared before writing to register TSG_CNTCVL.

TSG current counter value upper register (TSG_CNTCVU)

Address offset: 0x00C
 Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
CNTCVU_U_32[31:16]

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CNTCVU_U_32[15:0]															
r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w

Bits 31:0 **CNTCVU_U_32[31:0]**: timestamp counter current value (most significant 32 bits)
 To change the current timestamp value, write the least significant 32 bits of the new value to TSG_CNTCVL before writing the most significant 32 bits to this register. The 64-bit timestamp value is updated with the value from both writes when this register is written to.
Note: Bit EN of register TSG_CNTCR must be cleared before writing to register TSG_CNTCVU.

TSG base frequency ID register (TSG_CNTFID0)

Address offset: 0x020
 Reset value: 0x0000 0000

66.10.3 Cross trigger interface (CTI) and matrix (CTM)

The cross trigger interface (CTI) and cross trigger matrix (CTM) together form the CoreSight™ embedded cross trigger feature. There are four CTI components, one in the trace subsystem, one for each Cortex®-A7, and one dedicated to the Cortex®-M4. The CTIs are connected to each other via the CTM. The trace subsystem CTI and the Cortex®-A7

CTIs are accessible to the debugger via the debug APB. The Cortex®-M4 CTI is accessible on its private peripheral bus (PPB) via the Cortex®-M4 AHB access port.

Figure 826. Embedded cross trigger

The CTIs allow events from various sources to trigger debug and/or trace activity. For example, a breakpoint reached in one of the processor cores can stop the other processor, or a transition detected on an external trigger input can start code trace.

Each CTI has up to 8 trigger inputs and 8 trigger outputs. Any input can be connected to any output, on the same CTI, or on another CTI via the CTM.

The trigger input and output signals for each CTI are listed in [Table 582](#) to [Table 587](#).

Table 582. Trace Subsystem CTI inputs

	Source signal	Source component	Comments
0	DBTRIGI	GPIO	External trigger input - allows an external signal to generate a debug event
1	ETFACQCOMP	ETF	ETF capture finished - allows a debug event to be generated when the trace FIFO is empty
2	ETFFULL	ETF	ETF full flag - allows a debug event to be generated when the trace FIFO is full
3	TRIGOUTSPTE	STM	The STM asserts this signal for one clock cycle when a trigger event is detected on a match using the STMSPTER.
4	TRIGOUTSW	STM	The STM asserts this signal for one clock cycle when a trigger event is generated on writes to a TRIG location in the extended stimulus port registers.
5	TRIGOUTHETE	STM	The STM asserts this signal for one clock cycle when a trigger event is detected on a match using the STMHETER.
6	ASYNCOUT	STM	Alignment synchronization signal. The STM asserts this signal for one clock cycle when an ASYNC-VERSION-FREQ sequence is output on the ATB interface, and the ASYNCOUT signal can be used for cross-triggering.
7	-	-	Not used

Table 583. Trace Subsystem CTI outputs

	Output signal	Destination component	Comments
0	DBTRIGO	GPIO	External I/O trigger output - allows monitoring of events on the external DBTRIGO pin
1	TPIUFLUSH	TPIU	Trace port flush trigger - causes the TPIU FIFO to be flushed
2	TPIUTRIG	TPIU	Trace Port enable trigger - starts trace output on the external trace port
3	ETFTRIG	ETF	ETF enable trigger - starts filling the Trace FIFO
4	ETFFLUSH	ETF	ETF flush trigger - causes the Trace FIFO to be flushed
5	HWEVENTA	STM	STM hardware event
6	HWEVENTB	STM	STM hardware event
7	HLTDBG	TSGEN	Halts timestamp in debug - freezes the TSGEN timestamp counter

Table 584. Cortex[®]-A7_1/2 CTI inputs

	Source signal	Source component	Comments
0	DBGTRIGGER	Cortex [®] -A7 CPU	Pulsed high when the core enters in debug state
1	nPMUIRQ	PMU	Performance monitor interrupt
2	EXTOUT0	ETM	ETM external trigger output
3	EXTOUT1	ETM	ETM external trigger output
4	COMMTX	Cortex [®] -A7 CPU	Debug comm port transmit
5	COMMRX	Cortex [®] -A7 CPU	Debug comm port receive
6	ETMTRIGGER	ETM	ETM trigger
7	-	-	Not used

Table 585. Cortex[®]-A7_1/2 CTI outputs

	Output signal	Destination component	Comments
0	EDBGRQ	Cortex [®] -A7 CPU	CPU halt request - puts CPU in debug mode
1	EXTIN0	ETM	ETM external input
2	EXTIN1	ETM	ETM external input
3	EXTIN2	ETM	ETM external input
4	EXTIN3	ETM	ETM external input
5	-	-	Not used
6	nCTIIRQ	GIC	CTI interrupt
7	DBGRESTART	Cortex [®] -A7 CPU	CPU restart request - CPU exits debug mode

Table 586. Cortex[®]-M4 CTI inputs

	Source signal	Source component	Comments
0	HALTED	M4 CPU	CPU halted - indicates CPU is in debug mode
1	-	-	Not used
2	-	-	Not used
3	-	-	Not used
4	ETMTRIGGER0	M4 DWT	Trace trigger - enables CPU execution trace
5	ETMTRIGGER1	M4 DWT	Trace trigger - enables CPU execution trace
6	ETMTRIGGER2	M4 DWT	Trace trigger - enables CPU execution trace
7	ETMTRIGOUT	M4 ETM	ETM triggered - indicates trace active

Table 587. Cortex®-M4 CTI outputs

	Source signal	Destination component	Comments
0	EDBGRQ	M4 CPU	CPU halt request -puts CPU in debug mode
1	nIRQ1	M4 NVIC	CTI interrupt
2	nIRQ2	M4 NVIC	CTI interrupt
3	-	-	Not used
4	ETMEXTIN0	M4 ETM	ETM external input
5	ETMEXTIN1	M4 ETM	ETM external input
6	-	-	Not used
7	DBGRESTART	M4 ETM	CPU restart request - CPU exits debug mode

There are four event channels in the cross trigger matrix, which allows up to four, parallel, bidirectional connections between trigger inputs and outputs on different CTIs. To connect input number *m* on CTI *x* to output number *n* on CTI *y*, the input must be connected to an event channel *p* using the CTI_INEN_{*m*} register of CTI *x*. The same channel *p* must be connected to the output using the CTI_OUTEN_{*n*} register of CTI *y*.

Note: The above connection settings are also valid if the input and output belong to the same CTI.

An input can be connected to more than one channel (up to four). As a result, an input can be routed to several outputs. Similarly, an output can be connected to several inputs. It is also possible to connect several inputs/outputs to the same channel.

Figure 827. Mapping trigger inputs to outputs

Example configuration:

When either the MCU or the MPU hits a breakpoint, stop the other processor. Restart the two processors synchronously.

To stop both cores when either core stops requires the debug status output of each core (that is HALTED for the Cortex®-M4, DBGTRIGGER for the Cortex®-A7) to be connected to the EDBGRQ input of the opposite core.

Referring to [Table 584](#) and [Table 586](#), we see that the DBGTRIGGER signal from the Cortex®-A7_1 core is connected to input 0 of the Cortex®-A7_1 CTI, and the HALTED signal from the Cortex®-M4 core is connected to the same input on the Cortex®-M4

CTI. Hence we program the CTI_IEN0 register on each CTI to connect these inputs to a CTM channel (eg. channel 0).

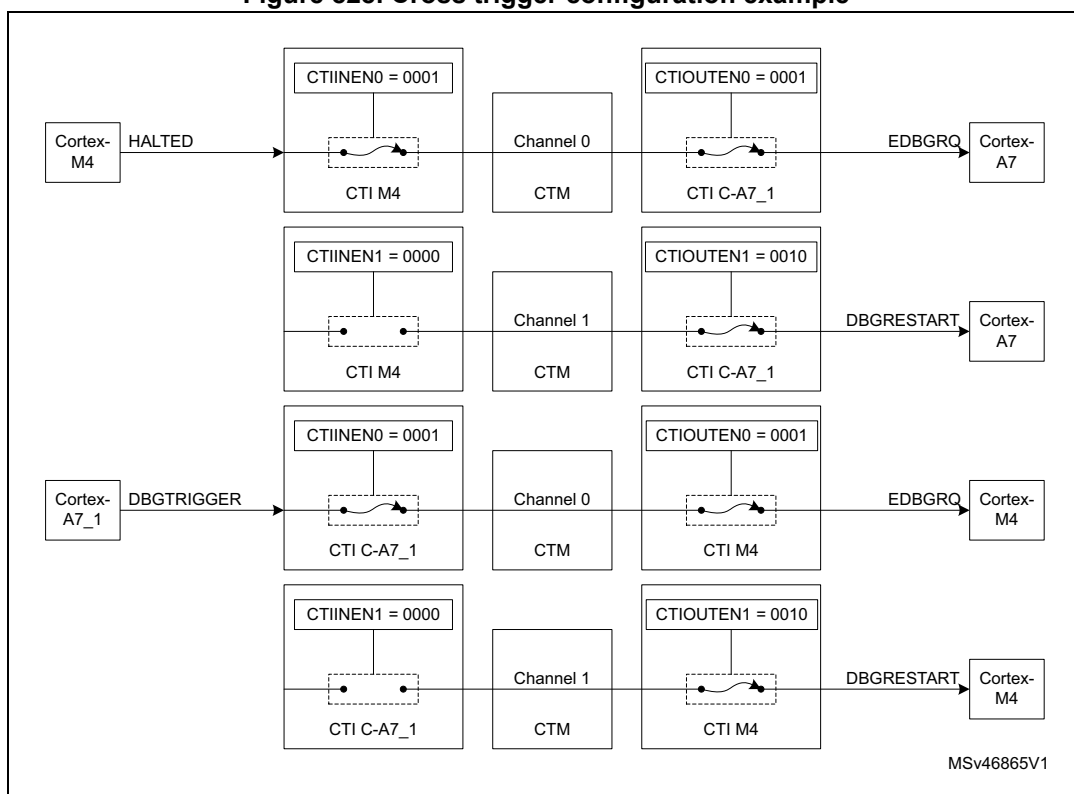

From [Table 585](#) and [Table 587](#) we see that the EDBGRRQ signals to the CPUs are connected to output 0 of the respective CTIs. So we program the CTI_OUTEN0 register on each CTI to connect these outputs to the same CTM channel.

To restart both cores simultaneously the debugger must use the CTI_APPULSE register in either of the CTIs. This allows the debugger to generate a pulse on any of the four ETM channels. The channel must be connected to the DBGRESTART signal of both cores.

From [Table 585](#) and [Table 587](#) we see that the DBGRESTART signals to the CPUs are connected to output 1 of the respective CTIs. So we program the CTI_OUTEN1 register on each CTI to connect these outputs to an unused CTM channel (eg. channel 1).

The above configuration is illustrated in [Figure 828](#).

Figure 828. Cross trigger configuration example

To force the processors to restart simultaneously, the debugger should use the following procedure:

1. Clear the debug request by writing 0x01, then 0x00, to the CTI_INTACK register in each CTI.
2. Cause a pulse on channel 1 by writing 0x02 to the CTI_APPULSE register in either CTI. This will generate a restart request to both processors.

Note that the debugger can also force both cores to stop simultaneously by writing 0x01 to the CTI_APPULSE register in either CTI, which generates a pulse on channel 0.

For more information on the cross trigger interface CoreSight™ component, refer to the *Arm® CoreSight™ SoC-400 Technical Reference Manual [2]*.

Cross trigger interface registers

The register file base address for each CTI is defined by the ROM table for the bus to which it is connected. The registers are the same for each CTI.

CTI control register (CTI_CONTROL)

Address offset: 0x000

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	GLBEN
															rw

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **GLBEN**: global enable

0: cross-triggering disabled

1: cross-triggering enabled

CTI trigger acknowledge register (CTI_INTACK)

Address offset: 0x010

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	INTACK[7:0]							
								w	w	w	w	w	w	w	w

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **INTACK[7:0]**: trigger acknowledge

There is one bit of the register for each CTITRIGOUT output. When a 1 is written to a bit in this register, the corresponding CTITRIGOUT output is acknowledged, causing it to be cleared.

CTI application trigger set register (CTI_APPSET)

Address offset: 0x014

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	APPSET[3:0]			
												rw	rw	rw	rw

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **APPSET[3:0]**: channel event set

Read:

- XXX0: channel 0 event inactive
- XXX1: channel 0 event active
- XX0X: channel 1 event inactive
- XX1X: channel 1 event active
- X0XX: channel 2 event inactive
- X1XX: channel 2 event active
- 0XXX: channel 3 event inactive
- 1XXX: channel 3 event active

Write:

- XXX0: no effect
- XXX1: sets event on channel 0
- XX0X: no effect
- XX1X: sets event on channel 1
- X0XX: no effect
- X1XX: sets event on channel 2
- 0XXX: no effect
- 1XXX: sets event on channel 3

CTI application trigger clear register (CTI_APPCLEAR)

Address offset: 0x018

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	APPCLEAR[3:0]			
												w	w	w	w

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **APPCLEAR[3:0]**: channel event clear

- XXX0: no effect
- XXX1: clears event on channel 0
- XX0X: no effect
- XX1X: clears event on channel 1
- X0XX: no effect
- X1XX: clears event on channel 2
- 0XXX: no effect
- 1XXX: clears event on channel 3

CTI application pulse register (CTI_APPPULSE)

Address offset: 0x01C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	APPULSE[3:0]				
													w	w	w	w

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **APPULSE[3:0]**: pulse channel event

- This register clears itself immediately.
- XXX0: no effect
- XXX1: generates pulse on channel 0
- XX0X: no effect
- XX1X: generates pulse on channel 1
- X0XX: no effect
- X1XX: generates pulse on channel 2
- 0XXX: no effect
- 1XXX: generates pulse on channel 3

CTI trigger in enable x registers (CTI_INENx)

Address offset: 0x020+ 0x04 * x, (x = 0 to 7)

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TRIGINEN[3:0]				
													rw	rw	rw	rw

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **TRIGINEN[3:0]**: cross-trigger event enable / disable

Enables or disables a cross-trigger event on each of the four channels when CTITRIGINn is activated (n = 0 to 7).

XXX0: trigger n does not generate events on channel 0

XXX1: trigger n generates events on channel 0

XX0X: trigger n does not generate events on channel 1

XX1X: trigger n generates events on channel 1

X0XX: trigger n does not generate events on channel 2

X1XX: trigger n generates events on channel 2

0XXX: trigger n does not generate events on channel 3

1XXX: trigger n generates events on channel 3

CTI Trigger out enable x registers (CTI_OUTENx)

Address offset: 0x0A0 + 0x04 * x, (x = 0 to 7)

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TRIGOUTEN[3:0]			
												rw	rw	rw	rw

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **TRIGOUTEN[3:0]**: output trigger enable / disable

For each channel, defines whether an event on that channel generates a trigger on CTITRIGOUTn (n = 0 to 7).

XXX0: channel 0 events does not generate triggers on trigger output n

XXX1: channel 0 events generates triggers on trigger output n

XX0X: channel 1 events does not generate triggers on trigger output n

XX1X: channel 1 events generates triggers on trigger output n

X0XX: channel 2 events does not generate triggers on trigger output n

X1XX: channel 2 events generates triggers on trigger output n

0XXX: channel 3 events does not generate triggers on trigger output n

1XXX: channel 3 events generates triggers on trigger output n

CTI trigger in status register (CTI_TRGISTS)

Address offset: 0x130

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TRIGINSTATUS[7:0]							
								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **TRIGINSTATUS[7:0]**: trigger input status

There is one bit of the register for each CTITRIGIN input. When a bit is set to 1, it indicates that the corresponding trigger input is active. When it is set to 0, the corresponding trigger input is inactive.

CTI Trigger out status register (CTI_TRGOSTS)

Address offset: 0x134

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TRIGOUTSTATUS[7:0]							
								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **TRIGOUTSTATUS[7:0]**: trigger output status

There is one bit of the register for each CTITRIGOUT output. When a bit is set to 1, it indicates that the corresponding trigger output is active. When it is set to 0, the corresponding trigger output is inactive.

CTI channel in status register (CTI_CHINSTS)

Address offset: 0x138

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CHINSTATUS[3:0]			
												r	r	r	r

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **CHINSTATUS[3:0]**: channel input status

There is one bit of the register for each channel input. When a bit is set to 1, it indicates that the corresponding channel input is active. When it is set to 0, the corresponding channel input is inactive.

CTI channel out status register (CTI_CHOUTSTS)

Address offset: 0x13C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CHOUTSTATUS[3:0]			
												r	r	r	r

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **CHOUTSTATUS[3:0]**: channel output status

There is one bit of the register for each channel output. When a bit is set to 1, it indicates that the corresponding channel output is active. When it is set to 0, the corresponding channel output is inactive.

CTI channel gate register (CTI_GATE)

Address offset: 0x140

Reset value: 0x0000 000F

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	GATEEN[3:0]			
												rw	rw	rw	rw

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **GATEEN[3:0]**: channel output enable

For each channel, defines whether an event on that channel can propagate over the CTM to other CTIs.

- XXX0: channel 0 events do not propagate
- XXX1: channel 0 events propagate
- XX0X: channel 1 events do not propagate
- XX1X: channel 1 events propagate
- X0XX: channel 2 events do not propagate
- X1XX: channel 2 events propagate
- 0XXX: channel 3 events do not propagate
- 1XXX: channel 3 events propagate

CTI claim tag set register (CTI_CLAIMSET)

Address offset: 0xFA0

Reset value: 0x0000 000F

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CLAIMSET[3:0]			
												rw	rw	rw	rw

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **CLAIMSET[3:0]**: sets claim tag bits

Write:

- 0000: no effect
- xxx1: sets bit 0
- xx1x: sets bit 1
- x1xx: sets bit 2
- 1xxx: sets bit 3

Read:

- 0xF: indicates there are four bits in claim tag

CTI claim tag clear register (CTI_CLAIMCLR)

Address offset: 0xFA4

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CLAIMCLR[3:0]			
												rw	rw	rw	rw

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **CLAIMCLR[3:0]**: resets claim tag bits

Write:

- 0000: no effect
- xxx1: clears bit 0
- xx1x: clears bit 1
- x1xx: clears bit 2
- 1xxx: clears bit 3

Read:

- Returns current value of claim tag

CTI lock access register (CTI_LAR)

Address offset: 0xFB0

Reset value: 0xFFFF XXXX

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
ACCESS_W[31:16]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ACCESS_W[15:0]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w

Bits 31:0 **ACCESS_W[31:0]**: CTI register write access enable
 Enables write access to some CTI registers by processor cores (debuggers do not need to unlock the component).
 0xC5ACCE55: enable write access
 Other values: disable write access

CTI lock status register (CTI_LSR)

Address offset: 0xFB4
 Reset value: 0x0000 0003

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	LOCKTYPE	LOCKGRANT	LOCKEXIST
													r	r	r

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **LOCKTYPE**: CTI_LAR register size
 Indicates the size of the CTI_LAR register.
 0: 32-bit

Bit 1 **LOCKGRANT**: current lock status
 This bit always reads as zero by an external debugger.
 0: write access is permitted
 1: write access is blocked. Only reads are permitted.

Bit 0 **LOCKEXIST**: lock control existence
 Indicates whether a lock control mechanism exists. This bit always reads as zero by an external debugger.
 0: no lock control mechanism exists
 1: lock control mechanism is implemented

CTI authentication status register (CTI_AUTHSTAT)

Address offset: 0xFB8
 Reset value: 0x0000 000A

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SNID[1:0]		SID[1:0]		NSNID[1:0]		NSID[1:0]	
								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:6 **SNID[1:0]**: security level for secure non-invasive debug
 0x0: not implemented

Bits 5:4 **SID[1:0]**: security level for secure invasive debug
 0x0: not implemented

Bits 3:2 **NSNID[1:0]**: security level for non-secure non-invasive debug
 0x2: disabled
 0x3: enabled

Bits 1:0 **NSID[1:0]**: security level for non-secure invasive debug
 0x2: disabled
 0x3: enabled

CTI device configuration register (CTI_DEVID)

Address offset: 0xFC8

Reset value: 0x0004 0800

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	NUMCH[3:0]			
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
NUMTRIG[7:0]								Res.	Res.	Res.	EXTMUXNUM[4:0]				
r	r	r	r	r	r	r	r				r	r	r	r	r

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:16 **NUMCH[3:0]**: number of ECT channels available
 0x4: 4 channels

Bits 15:8 **NUMTRIG[7:0]**: number of ECT triggers available
 0x8: 8 trigger inputs and 8 trigger outputs

Bits 7:5 Reserved, must be kept at reset value.

Bits 4:0 **EXTMUXNUM[4:0]**: number of trigger input/output multiplexers
 0x0: none

CTI device type Identifier register (CTI_DEVTYPE)

Address offset: 0xFCC

Reset value: 0x0000 0014

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SUBTYPE[3:0]				MAJORTYPE[3:0]			
								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **SUBTYPE[3:0]**: sub-classification

0x1: indicates that this component is a cross-triggering component

Bits 3:0 **MAJORTYPE[3:0]**: major classification

0x4: indicates that this component allows a debugger to control other components in a CoreSight™ SoC-400 system

CTI CoreSight peripheral identity register 4 (CTI_PIDR4)

Address offset: 0xFD0

Reset value: 0x0000 0004

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SIZE[3:0]				JEP106CON[3:0]			
								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **SIZE[3:0]**: register file size

0x0: register file occupies a single 4-Kbyte region

Bits 3:0 **JEP106CON[3:0]**: JEP106 continuation code

0x4: Arm® JEDEC code

CTI CoreSight peripheral identity register 0 (CTI_PIDR0)

Address offset: 0xFE0

Reset value: 0x0000 0006

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	PARTNUM[7:0]							
								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **PARTNUM[7:0]**: part number bits [7:0]
 0x06: CTI part number

CTI CoreSight peripheral identity register 1 (CTI_PIDR1)

Address offset: 0xFE4

Reset value: 0x0000 00B9

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	JEP106ID[3:0]			PARTNUM[11:8]				
								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **JEP106ID[3:0]**: JEP106 identity code bits [3:0]
 0xB: Arm® JEDEC code

Bits 3:0 **PARTNUM[11:8]**: part number bits [11:8]
 0x9: CTI part number

CTI CoreSight peripheral identity register 2 (CTI_PIDR2)

Address offset: 0xFE8

Reset value: 0x0000 004B

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	REVISION[3:0]			JEDEC	JEP106ID[6:4]			
								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **REVISION[3:0]**: component revision number
 0x4: r0p5

Bit 3 **JEDEC**: JEDEC assigned value
 0x1: designer ID specified by JEDEC

Bits 2:0 **JEP106ID[6:4]**: JEP106 identity code bits [6:4]
 0x3: Arm® JEDEC code

CTI CoreSight peripheral identity register 3 (CTI_PIDR3)

Address offset: 0xFEC

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	REVAND[3:0]				CMOD[3:0]			
								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **REVAND[3:0]**: metal fix version
 0x0: no metal fix

Bits 3:0 **CMOD[3:0]**: customer modified
 0x0: no customer modifications

CTI CoreSight component identity register 0 (CTI_CIDR0)

Address offset: 0xFF0

Reset value: 0x0000 000D

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

66.10.4 Trace funnel (CSTF)

The trace funnel is a CoreSight™ component that combines the ATB buses from the five trace sources into one single ATB. The CSTF has five ATB slave ports, and one ATB master port. An arbiter selects the slave ports according to a programmable priority.

The slave ports are connected as follows:

- S0: STM
- S1: Cortex®-A7_1 ETM
- S2: Cortex®-A7_2 ETM
- S3: Cortex®-M4 ETM
- S4: Cortex®-M4 ITM

The CSTF registers allow the slave ports to be individually enabled, and their priority settings to be configured. The priorities can be modified only when trace is disabled. The arbitration works as follows:

- The arbiter selects the slave port with the highest assigned priority that has data valid
- Up to *min_hold_time* transfers are passed from the selected slave to the master port, where *min_hold_time* is programmable in the CONTROL register.
- A new arbitration is then performed

High priority should be assigned to slave ports connected to sources with a small amount of buffering, or where data loss can not be tolerated. Low priority should be assigned to less critical sources or those with large buffers.

For more information on the ATB Funnel CoreSight™ component, refer to the *Arm® CoreSight™ SoC-400 Technical Reference Manual [2]*.

Trace funnel registers

CSTF control register (CSTF_CTRL)

Address offset: 0x000

Reset value: 0x0000 0300

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	MIN_HOLD_TIME[3:0]				Res.	Res.	Res.	ENS4	ENS3	ENS2	ENS1	ENS0
				rw	rw	rw	rw				rw	rw	rw	rw	rw

Bits 31:12 Reserved, must be kept at reset value.

Bits 11:8 **MIN_HOLD_TIME[3:0]**: number of transactions between each arbitration

- 0x0: 1 transaction
- :
- 0xE: 15 transactions
- 0xF: reserved

Bits 7:5 Reserved, must be kept at reset value.

Bit 4 **ENS4**: slave port S4 enable

- 0: disables port
- 1: enables port

Bit 3 **ENS3**: slave port S3 enable

- 0: disables port
- 1: enables port

Bit 2 **ENS2**: slave port S2 enable
 0: disables port
 1: enables port

Bit 1 **ENS1**: slave port S1 enable
 0: disables port
 1: enables port

Bit 0 **ENS0**: slave port S0 enable
 0: disables port
 1: enables port

CSTF priority register (CSTF_PRIORITY)

Address offset: 0x004

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	PRIPORT4[2:0]			PRIPORT3[2:0]			PRIPORT2[2:0]			PRIPORT1[2:0]			PRIPORT0[2:0]		
	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:15 Reserved, must be kept at reset value.

Bits 14:12 **PRIPORT4[2:0]**: slave port S4 priority
 0: highest priority
 :
 7: lowest priority

Bits 11:9 **PRIPORT3[2:0]**: slave port S3 priority
 0: highest priority
 :
 7: lowest priority

Bits 8:6 **PRIPORT2[2:0]**: slave port S2 priority
 0: highest priority
 :
 7: lowest priority

Bits 5:3 **PRIPORT1[2:0]**: slave port S1 priority
 0: highest priority
 :
 7: lowest priority

Bits 2:0 **PRIPORT0[2:0]**: slave port S0 priority
 0: highest priority
 :
 7: lowest priority

CSTF claim tag set register (CSTF_CLAIMSET)

Address offset: 0xFA0

Reset value: 0x0000 000F

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CLAIMSET[3:0]			
												rw	rw	rw	rw

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **CLAIMSET[3:0]**: sets claim tag bits

Write:

- 0000: no effect
- xxx1: sets bit 0
- xx1x: sets bit 1
- x1xx: sets bit 2
- 1xxx: sets bit 3

Read:

- 0xF: indicates that there are four bits in claim tag

CSTF claim tag clear register (CSTF_CLAIMCLR)

Address offset: 0xFA4

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CLAIMCLR[3:0]			
												rw	rw	rw	rw

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **CLAIMCLR[3:0]**: resets claim tag bits

Write:

- 0000: no effect
- xxx1: clears bit 0
- xx1x: clears bit 1
- x1xx: clears bit 2
- 1xxx: clears bit 3

Read:

- Returns current value of claim tag

CSTF lock access register (CSTF_LAR)

Address offset: 0xFB0

Reset value: 0xFFFF XXXX

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
ACCESS_W[31:16]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ACCESS_W[15:0]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w

Bits 31:0 **ACCESS_W[31:0]**: CTI register write access enable
 Enables write access to some CTI registers by processor cores (debuggers do not need to unlock the component).
 0xC5ACCE55: enable write access
 Other values: disable write access

CSTF lock status register (CSTF_LSR)

Address offset: 0xFB4

Reset value: 0x0000 0003

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	LOCKTYPE	LOCKGRANT	LOCKEXIST
													r	r	r

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **LOCKTYPE**: CSTF_LAR register size
 Indicates the size of the CSTF_LAR register.
 0: 32-bit

Bit 1 **LOCKGRANT**: current lock status
 This bit always reads as zero by an external debugger.
 0: write access is permitted
 1: write access is blocked. Only reads are permitted.

Bit 0 **LOCKEXIST**: lock control existence
 Indicates whether a lock control mechanism exists. This bit always reads as zero by an external debugger.
 0: no lock control mechanism exists
 1: lock control mechanism is implemented

CSTF authentication status register (CSTF_AUTHSTAT)

Address offset: 0xFB8

Reset value: 0x0000 000A

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SNID[1:0]		SID[1:0]		NSNID[1:0]		NSID[1:0]	
								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:6 **SNID[1:0]**: security level for secure non-invasive debug
 0x0: not implemented

Bits 5:4 **SID[1:0]**: security level for secure invasive debug
 0x0: not implemented

Bits 3:2 **NSNID[1:0]**: security level for non-secure non-invasive debug
 0x0: not implemented

Bits 1:0 **NSID[1:0]**: security level for non-secure invasive debug
 0x0: not implemented

CSTF CoreSight device identity register (CSTF_DEVID)

Address offset: 0xFC8

Reset value: 0x0000 0024

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SCHEME[3:0]				PORTCNT[3:0]			
								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **SCHEME[3:0]**: priority scheme
 0x2: static priority

Bits 3:0 **PORTCNT[3:0]**: number of input ports connected
 0x4: four input ports

CSTF CoreSight device identity register (CSTF_TYPEID)

Address offset: 0xFCC

Reset value: 0x0000 0012

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DEVTYPEID[7:0]							
								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **DEVTYPEID[7:0]**: device type identifier
 0x12: trace funnel

CSTF CoreSight peripheral identity register 0 (CSTF_PIDR0)

Address offset: 0xFE0

Reset value: 0x0000 0008

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

66.10.5 Embedded trace FIFO (ETF)

The ETF is an 8-kbyte memory which captures trace data from five trace sources, namely the ETM of each CPU core, the ITM of the Cortex[®]-M4, and the STM. The ETF is a configuration of the CoreSight[™] Trace Memory Controller component.

The ETF can be used in three modes (selected in the Mode register):

1. Hardware FIFO mode

The trace memory is used as a FIFO that is drained through the ATB master interface. Trace data is captured into the Trace RAM and when full, the incoming trace stream is stalled. When the Trace buffer is not empty, trace data is drained out through the ATB master interface to the TPIU.

In this mode, the role of the FIFO is to smooth the flow of trace information arriving at the trace port. Since the trace data can be very bursty in nature, the peak data rate can

easily exceed the port capability, resulting in an overflow. The ETF allows a steady data rate at the trace port, which can then be sized according to the average rate rather than the peak. The trace is stored off-chip in real time by the trace port analyser tool, and so the trace log can be very big.

2. Software FIFO mode

The trace memory is used as a FIFO that can be read through the RRD Register while trace is being captured. Trace data is captured into the Trace RAM and when full, the incoming trace stream is stalled.

This mode allows the trace to be transferred by DMA into the system memory, or to a high speed interface (SPI, USB etc), or even monitored by software running on one of the cores. Note that unlike the hardware FIFO mode, this mode is invasive, since it uses system resources which are shared by the processors.

3. Circular buffer mode

The trace memory is used as a circular buffer. Trace data is captured into the Trace memory starting from the location pointed to by the write pointer register. Even when the trace memory is full, incoming trace data continues to be overwritten into the trace memory until a stop condition occurs.

In this mode, the ETF stores the trace data on-chip, so the trace log size is limited to that of the ETF SRAM, 8 kbytes in this case. Being a circular buffer, if the FIFO becomes full, incoming trace data will overwrite the oldest stored data, which will be lost. Therefore the contents of the trace buffer represent the most recent activity of the processor(s), up to the point when the buffer was stopped, rather than all the activity since the trace was started.

There are three possible methods to read out the buffer contents once the trace has stopped:

- via the Trace Port - with the TPIU enabled, the contents of the buffer are output over the trace port. This can be done by setting the DrainBuffer bit in the ETF_FFCCR register.
- via the Debug Port - the debugger can read the buffer via the RRD register which is accessible over the debug APB.
- by software - either processor can read the buffer via the RRD register, since the debug APB is accessible from the system bus. This could also be performed by software triggered DMA transfers. No hardware DMA request is available so the FULL flag can be used to trigger an interrupt to the appropriate core via the cross trigger. The software can then read the ETF_CBUFLVL register to find out the number of data to be read.

For more information on the Trace Memory Controller CoreSight™ component, refer to the *Arm® CoreSight™ Trace Memory Controller Technical Reference Manual [3]*.

Embedded trace FIFO registers

ETF RAM size register (ETF_RSZ)

Address offset: 0x004

Reset value: 0x0000 0800

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	RSZ[30:16]														
	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RSZ[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bit 31 Reserved, must be kept at reset value.

Bits 30:0 **RSZ[30:0]**: size of the RAM in 32-bit words
 0x800: 8 Kbytes

ETF status register (ETF_STS)

Address offset: 0x00C

Reset value: 0x0000 001C

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	EMPTY	FEMPTY	READY	TRIGD	FULL
											r	r	r	r	r

Bits 31:5 Reserved, must be kept at reset value.

Bit 4 **EMPTY**: trace FIFO empty

This bit is valid only when the TCEN bit of the ETF_CTL register is high. This bit reads as zero when TCEN is low.

0: trace FIFO contains data

1: trace FIFO is empty

Note: EMPTY does not inform about ETF pipeline emptiness which is indicated by FEMPTY.

Bit 3 **FEMPTY**: formatter empty

This bit is set when trace capture has stopped, and all internal pipelines and buffers have drained. Unlike READY, it is not affected by buffer drains. The ACQCOMP output reflects the value of this bit.

Bit 2 **READY**: ETF ready

This bit is set when trace capture has stopped and all internal pipelines and buffers have drained (STOPPED or DISABLED mode)

Bit 1 **TRIGD**: triggered

Bit triggered is set when trace capture is in progress and the TMC has detected a trigger event. This bit is cleared when leaving disabled state.

This bit is operational only in the circular buffer mode. In all other modes, this bit is always low.

This bit does not indicate that a trigger has been embedded in the formatted output trace data from the TMC. Trigger indication on the output trace stream is determined by the programming of the Formatter and Flush Control Register, ETF_FFCR.

Bit 0 **FULL**: trace buffer full

In circular buffer mode, this flag is set when the RAM write pointer wraps around the top of the buffer, and remains set until the TCEN bit of the ETF_CTL register is cleared and set.

In software and hardware FIFO modes, this flag indicates that the current space in the trace memory is less than or equal to the value programmed in the ETF_BUFWM register, that is, Fill level \geq MEM_SIZE - BUFWM.

This bit is cleared when leaving the disabled state. The FULL output reflects the value of this register bit.

ETF RAM read data register (ETF_RRD)

Address offset: 0x010

Reset value: 0xXXXX XXXX

Bits 31:0 **RRD[31:0]**: RAM read data

Circular buffer mode: When in stopped state and the buffer is not empty, reading this register returns the next word of data from the trace buffer. When all of the trace buffer has been read, the EMPTY bit in the ETF_STS Register is set, and subsequent reads return 0xFFFF FFFF. Reading this register when not in stopped state returns 0xFFFF FFFF.

Software FIFO mode: Reading this register returns data from the FIFO. If this register is read when the FIFO is empty, the data returned is 0xFFFF FFFF.

Hardware FIFO mode: Reading this register returns 0xFFFF FFFF.

ETF RAM read pointer register (ETF_RRP)

Address offset: 0x014

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	RRP[12:0]												
			rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:13 Reserved, must be kept at reset value.

Bits 12:0 **RRP[12:0]**: RAM read pointer

The RAM read pointer register contains the value of the read pointer that is used to read entries from the trace memory over the APB interface via the ETF_RRD register. The pointer can be programmed with a byte address, 64-bit aligned (bits 0 to 3 should be zero). The pointer is incremented by 8 each time a full 64-bit FIFO entry has been written. When the pointer reaches its maximum value, it wraps around.

This register can only be written in DISABLED state. It can be read in DISABLED state, in STOPPED state in circular buffer mode and SW FIFO mode, and also in RUNNING and STOPPING states in SW FIFO mode.

ETF RAM write pointer register (ETF_RWP)

Address offset: 0x018

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	RWP[12:0]												
			rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:13 Reserved, must be kept at reset value.

Bits 12:0 **RWP[12:0]**: RAM write pointer

The RAM write Pointer Register contains the value of the write pointer that is used to write entries into the trace memory over the APB interface via the ETF_RWD register. The pointer can be programmed with a byte address, 64-bit aligned (meaning that bits 0 to 3 should be zero). The pointer is incremented by 8 each time a full 64-bit FIFO entry has been read. When the pointer reaches its maximum value, it wraps around.

This register can only be written in DISABLED state. It can be read in DISABLED state, in STOPPED state in circular buffer mode and SW FIFO mode, and also in RUNNING and STOPPING states in SW FIFO mode.

ETF trigger counter register (ETF_TRG)

Address offset: 0x01C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	TRG[10:0]										
					rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:11 Reserved, must be kept at reset value.

Bits 10:0 **TRG[10:0]**: trigger counter

In circular buffer mode, specifies the number of 32-bit words to capture in the trace RAM following the detection of either a rising edge on the TRIGIN input or a trigger packet in the incoming trace stream, ATID =7'h7D. On capturing the specified number of data words, a trigger event occurs. The effect of a trigger event on the ETF behavior is controlled by the ETF_FFCR register.

The number of 32-bit words written into the Trace RAM following the trigger is the value stored in this register, plus one. This register is ignored when the ETF is in software FIFO mode or hardware FIFO mode. When the trigger counter starts counting, any additional triggers, either on TRIGIN or in the incoming trace stream, are ignored until the counter reaches zero. When the trigger counter has reached zero, it remains at zero until it is re-programmed with a write to this register.

This register is cleared when READY goes HIGH, so that the state of the counter when trace capture has stopped does not affect a subsequent trace capture session. Writing to this register when not in DISABLED state results in unpredictable behavior.

A read access to this register is permitted at any time when in DISABLED state, or in circular buffer mode. A read access returns the current value of the trigger counter.

ETF control register (ETF_CTL)

Address offset: 0x020

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TCEN
															rw

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **TCEN**: trace capture enable

When writing:

0: disables trace capture (moves from RUNNING, STOPPING or STOPPED state into DISABLING or DISABLED state)

1: enables trace capture (moves from DISABLED state into RUNNING state)

When reading, this bit is low when in DISABLING or DISABLED states, and high otherwise.

ETF RAM write data register (ETF_RWD)

Address offset: 0x024

Reset value: 0xFFFF XXXX

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
RWD[31:16]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RWD[15:0]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w

Bits 31:0 **RWD[31:0]**: RAM write data

When in DISABLED state, a write to this register stores data at the location pointed to by the RWP. Writes to this register when not in disabled state are ignored. When a full memory width (64-bit) of data has been written, the data is written to memory and the RAM write pointer is incremented to the next memory word.

This register is used for test purposes.

ETF mode register (ETF_MODE)

Address offset: 0x028

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	MODE[1:0]	
														rw	rw

Bits 31:2 Reserved, must be kept at reset value.

Bits 1:0 **MODE[1:0]**: operation mode

- 0: circular buffer mode. In this mode, the trace memory is used as a circular buffer. Trace data is captured into the trace memory starting from the location pointed to by the write pointer register. Even when the trace memory is full, incoming trace data continues to be overwritten into the trace memory until a stop condition has occurred.
- 1: software FIFO mode. In this mode, the trace memory is used as a FIFO that can be read through the ETF_RRD Register while trace is being captured. Trace data is captured into the trace RAM and when full, the incoming trace stream is stalled.
- 2: hardware FIFO mode. In this mode, the trace memory is used as a FIFO that is drained through the ATB master interface. Trace data is captured into the trace RAM and when full, the incoming trace stream is stalled. When the trace buffer is non-empty, trace data is drained out through the ATB master interface to the TPIU.
- 3: reserved

ETF latched buffer fill level register (ETF_LBUFLVL)

Address offset: 0x02C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	LBUFLEVEL[11:0]											
				r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:12 Reserved, must be kept at reset value.

Bits 11:0 **LBUFLEVEL[11:0]**: latched buffer fill level

Reading this register returns the maximum fill level of the trace memory in 32-bit words since this register was last read. Reading this register also results in its contents being updated to the current fill level.

When entering disabled state, this register retains its last value. While in disabled state, reads from this register do not affect its value. When exiting disabled state, the ETF_LBUFLVL register is cleared.

This register is used for performance analysis of the trace system.

ETF current buffer fill level register (ETF_CBUFLVL)

Address offset: 0x030

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	CBUFLEVEL[11:0]											
				r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:12 Reserved, must be kept at reset value.

Bits 11:0 **CBUFLEVEL[11:0]**: current buffer fill level

Reading this register returns the current fill level of the trace memory in 32-bit words.

This register is cleared when ETF_CTL.TCEN is low.

ETF buffer level watermark register (ETF_BUFWM)

Address offset: 0x034

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	BUFWM[10:0]										
					r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w

Bits 31:11 Reserved, must be kept at reset value.

Bits 10:0 **BUFWM[10:0]**: buffer level watermark

The value programmed into this register indicates the required threshold vacancy level in 32-bit words in the trace memory. When the space in the FIFO is less than or equal to this value, that is, Fill level \geq MEM_SIZE - BUFWM, the FULL output is pulled high and the FULL bit in the ETF_STS register is set.

This register is used only in software FIFO and hardware FIFO modes. In circular buffer mode, this functionality can be obtained by programming ETF_RWP to the required vacancy trigger level, so that when the pointer wraps around, the FULL bit is set indicating that the vacancy level has fallen below the required level.

The maximum value that can be written into this register is MEM_SIZE - 1; in this case, the FULL bit output is asserted after the first 32-bit word is written to trace memory.

Writing to this register other than when in DISABLED state results in unpredictable behavior.

ETF formatter and flush status register (ETF_FFSR)

Address offset: 0x300

Reset value: 0x0000 0002

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	FTSTOPPED	FLINPROG
														rw	rw

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **FTSTOPPED**: formatter stopped

This bit behaves in the same way as the FEMPTY bit in the ETF_STS register.

Bit 0 **FLINPROG**: flush in progress

Indicates whether a flush on the ATB slave port is in progress. This bit reflects the status of the AFVALIDS output. A flush can be initiated by the flush control bits in the ETF_FFCR register, or requested by the ATB master port.

0: no flush in progress

1: flush in progress

ETF formatter and flush control register (ETF_FFCR)

Address offset: 0x304

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	DRAINBUF	STPONTRGEV	STOPONFL	Res.	TRIGONFL	TRGONTRGEV	TRGONTRGIN	Res.	FLUSHMAN	FONTRGEV	FONFLIN	Res.	Res.	ENTI	ENFT
	rw	rw	rw		rw	rw	rw		rw	rw	rw			rw	rw

Bits 31:15 Reserved, must be kept at reset value.

Bit 14 DRAINBUF: drain buffer

This bit is used to enable draining of the trace data through the ATB master interface after the formatter has stopped. This is useful in circular buffer mode to capture trace data into trace memory and then to drain the captured trace through the ATB master interface.

Writing a one to this bit when in stopped state starts the drain of the contents of the trace buffer through the ATB master interface. This bit always reads as zero. The READY bit in the ETF_STS register goes low while the drain is in progress.

This bit is functional only when the ETF is in circular buffer mode and formatting is enabled, that is if the ENFT bit in the ETF_FFCR register is set. Setting this bit when the ETF is in any other mode, or when not in stopped state, results in unpredictable behavior.

When trace capture is complete in circular buffer mode, all of the captured trace must be retrieved from the trace memory through the same mechanism, either read all trace data out through ETF_RRD reads, or drain all trace data by setting the DRAINBUF bit. Setting the DRAINBUF bit after some of the captured trace has been read out through ETF_RRD results in unpredictable behavior.

Bit 13 STPONTRGEV: stop on trigger event

0: no effect

1: stop trace capture when a trigger event occurs

Note: Enabling the ETF in software FIFO mode or hardware FIFO mode with this bit set results in unpredictable behavior.

Bit 12 STOPONFL: stop on flush

0: no effect

1: stops trace capture when flush is completed

If a flush is initiated by the ATB master interface, its completion does not lead to a formatter stop regardless of the value programmed in this bit.

Bit 11 Reserved, must be kept at reset value.

Bit 10 TRIGONFL: trigger on flush

0: no effect

1: indicates a trigger in the trace stream when flush is completed

If ENFT and ENTI are both clear, this bit is ignored and no trigger is inserted into the trace stream.

If a flush is initiated by the ATB master interface, its completion does not lead to a trigger indication regardless of the value programmed in this bit.

- Bit 9 **TRGONTRGEV**: trigger on trigger event
 0: no effect
 1: indicates a trigger in the trace stream when trigger event occurs
 If ENFT and ENTI are both clear, this bit is ignored and no trigger is inserted into the trace stream.
 This bit is not supported in software FIFO mode or hardware FIFO mode.
- Bit 8 **TRGONTRGIN**: trigger on trigger in
 0: no effect
 1: indicates a trigger in the trace stream when a rising edge is detected on the TRIGIN input
 If ENFT and ENTI are both clear, this bit is ignored and no trigger is inserted into the trace stream.
- Bit 7 Reserved, must be kept at reset value.
- Bit 6 **FLUSHMAN**: manual flush
 0: no effect
 1: flushes the trace FIFO and pipeline
 This bit is cleared automatically when the flush completes. If the TCEN bit in the ETF_CTL register is 0, writes to this bit are ignored.
- Bit 5 **FONTRGEV**: flush on trigger event
 0: no effect
 1: flushes the trace FIFO and pipeline if a trigger event occurs
 This bit is not supported in software FIFO mode or hardware FIFO mode. If STPONTRGEV is set, this bit is ignored.
- Bit 4 **FONFLIN**: flush on flush in
 0: no effect
 1: flushes the trace FIFO and pipeline when a rising edge is detected on the FLUSHIN input
- Bits 3:2 Reserved, must be kept at reset value.
- Bit 1 **ENTI**: enable trigger insertion
 Setting this bit enables the insertion of triggers in the formatted trace stream. A trigger is indicated by inserting one byte of data 8'h00 with ATID 7'h7D in the trace stream. Trigger indication on the trace stream is additionally controlled by the register bits TRIGONFL, TRGONTRGEV, and TRGONTRGIN in the ETF_FFCCR Register. This bit can only be changed when READY is high, and TCEN is low. This bit takes effect only when the ENFT register bit in this register is set. If the ENTI bit is set to high when ENFT is low, it results in formatting being enabled.
- Bit 0 **ENFT**: enable formatting
 0: formatting is disabled. Incoming trace data is assumed to be from a single trace source
 1: formatting is enabled
 If multiple ATIDs are received by the ETF when trace capture is enabled and the formatter is disabled, it results in interleaving of trace data. Disabling of formatting is supported only in circular buffer mode. If the ETF is enabled in a mode other than circular buffer mode with ENFT low, it results in formatting being enabled. If the ENTI bit is set to high when ENFT is low, it results in formatting being enabled.
 This bit is ignored when in disabled state.

ETF periodic synchronisation counter register (ETF_PSCR)

Address offset: 0x308

Reset value: 0x0000 000A

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	PSCOUNT[4:0]				
											rw	rw	rw	rw	rw

Bits 31:5 Reserved, must be kept at reset value.

Bits 4:0 **PSCOUNT[4:0]**: synchronization counter reload value

PSCOUNT determines the reload value of the synchronization counter. The reload value takes effect the next time the counter reaches zero. Reads from this register return the reload value programmed into this register. This register is set to 0xA on reset, corresponding to a synchronization period of 1024 bytes.

0x0: synchronization disabled

0x1-0x6: reserved

0x7-0x1B: synchronization period is $2^{PSCOUNT}$ bytes

Others: reserved

ETF claim tag set register (ETF_CLAIMSET)

Address offset: 0xFA0

Reset value: 0x0000 000F

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CLAIMSET[3:0]			
												rw	rw	rw	rw

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **CLAIMSET[3:0]**: sets claim tag bits

Write:

- 0000: no effect
- xxx1: sets bit 0
- xx1x: sets bit 1
- x1xx: sets bit 2
- 1xxx: sets bit 3

Read:

- 0xF: indicates there are four bits in claim tag

ETF claim tag clear register (ETF_CLAIMCLR)

Address offset: 0xFA4

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CLAIMCLR[3:0]			
												rw	rw	rw	rw

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **CLAIMCLR[3:0]**: resets claim tag bits

Write:

- 0000: no effect
- xxx1: clears bit 0
- xx1x: clears bit 1
- x1xx: clears bit 2
- 1xxx: clears bit 3

Read:

- Returns current value of claim tag

ETF lock access register (ETF_LAR)

Address offset: 0xFB0

Reset value: 0XXXXX XXXX

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
ACCESS_W[31:16]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ACCESS_W[15:0]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w

Bits 31:0 **ACCESS_W[31:0]**: ETF register write access enable

Enables write access to some ETF registers by processor cores (debuggers do not need to unlock the component).

0xC5ACCE55: enable write access

Other values: disable write access

ETF lock status register (ETF_LSR)

Address offset: 0xFB4

Reset value: 0x0000 0003

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	LOCKTYPE	LOCKGRANT	LOCKEXIST
													r	r	r

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **LOCKTYPE**: ETF_LAR register size
 Indicates the size of the ETF_LAR register.
 0: 32-bit

Bit 1 **LOCKGRANT**: current lock status
 This bit always reads as zero by an external debugger.
 0: write access is permitted
 1: write access is blocked. Only reads are permitted.

Bit 0 **LOCKEXIST**: lock control existence
 Indicates whether a lock control mechanism exists. This bit always reads as zero by an external debugger.
 0: no lock control mechanism exists
 1: lock control mechanism is implemented

ETF authentication status register (ETF_AUTHSTAT)

Address offset: 0xFB8

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

66.10.6 Trace port interface unit (TPIU)

The TPIU is a CoreSight™ component that formats the trace stream and outputs it on the external trace port signals. The TPIU has a single ATB slave port for incoming trace data. The trace port is a synchronous parallel port, comprising a clock output, TRACECLK, and sixteen data outputs, TRACED(15:0). The trace port width is programmable in the range 1 to 16. Using a smaller port width reduces the number of test points/connector pins needed, and frees up I/Os for other purposes. However it restricts the bandwidth of the trace port and hence the quantity of trace information that can be output in real time.

For more information on the Trace Port Interface CoreSight™ component, refer to the *Arm® CoreSight™ SoC-400 Technical Reference Manual [2]*.

Trace port interface unit registers

TPIU supported port size register (TPIU_SUPPSIZE)

Address offset: 0x000

Reset value: 0x0000 FFFF

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
PORTSIZE[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
PORTSIZE[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **PORTSIZE[31:0]**: supported trace port sizes
 Indicates supported trace port sizes, from 1 to 32 pins. Bit n-1 when set indicates that port size n is supported.
 0x0000 FFFF: port sizes 1 to 16 supported

TPIU current port size register (TPIU_CURPSIZE)

Address offset: 0x004
 Reset value: 0x0000 FFFF

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
PORTSIZE[31:16]															
r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
PORTSIZE[15:0]															
r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w

Bits 31:0 **PORTSIZE[31:0]**: current trace port size
 Indicates current trace port size. Bit n-1 when set indicates that the current port size is n pins. The value of n must be within the range of supported port sizes (1-4). Only one bit can be set, or unpredictable behavior may result. This register should only be modified when the formatter is stopped.

TPIU supported trigger modes register (TPIU_SUPTRGM)

Address offset: 0x100
 Reset value: 0x0000 011F

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	TCOUNT8	Res.	Res.	Res.	MULT64K	MULT256	MULT16	MULT4	MULT2
							r				r	r	r	r	r

Bits 31:18 Reserved, must be kept at reset value.

Bit 17 **TRGRUN**: trigger running
 0: trigger has not occurred or counter is at 0
 1: trigger has occurred and counter is not at 0

Bit 16 **TRIGD**: triggered
 0: trigger has not occurred
 1: trigger has occurred and counter has reached 0

Bits 15:9 Reserved, must be kept at reset value.

Bit 8 **TCOUNT8**: 8-bit counter register
 1: implemented

Bits 7:5 Reserved, must be kept at reset value.

Bit 4 **MULT64K**: multiplying the trigger counter by 65536 support
 1: supported

Bit 3 **MULT256**: multiplying the trigger counter by 256 support
 1: supported

Bit 2 **MULT16**: multiplying the trigger counter by 16 support
 1: supported

Bit 1 **MULT4**: multiplying the trigger counter by 4 support
 1: supported

Bit 0 **MULT2**: multiplying the trigger counter by 2 support
 1: supported

TPIU trigger counter value register (TPIU_TRGCNT)

Address offset: 0x104

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TRIGCOUNT[7:0]							
								rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **TRIGCOUNT[7:0]**: trigger delay to external enable
 Enables delaying the indication of triggers to any external connected trace capture or storage devices.
 This counter is only eight-bit wide and is intended to be used only with the counter multipliers in the TPIU_TRGMULT trigger multiplier register. When a trigger is started, this value, in combination with the multiplier, is the number of words before the trigger is indicated. When the trigger counter reaches 0, the value written here is reloaded. Writing to this register causes the trigger counter value to reset but does not reset any values on the multiplier. Reading this register returns the preset value, not the current count.

TPIU trigger multiplier register (TPIU_TRGMULT)

Address offset: 0x108

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	PATF0	PATA5	PATW0	PATW1
												r	r	r	r

Bits 31:18 Reserved, must be kept at reset value.

Bit 17 **PCONTEN**: continuous mode support
 Indicates whether continuous mode is supported.
 1: supported

Bit 16 **PTIMEEN**: timed mode support
 Indicates whether timed mode is supported.
 1: supported

Bits 15:4 Reserved, must be kept at reset value.

Bit 3 **PATF0**: FF/00 pattern support
 Indicates whether the FF/00 pattern is supported as output over the trace port.
 1: supported

Bit 2 **PATA5**: AA/55 pattern support
 Indicates whether the AA/55 pattern is supported as output over the trace port.
 1: supported

Bit 1 **PATW0**: walking 0's pattern support
 Indicates whether the walking 0's pattern is supported as output over the trace port.
 1: supported

Bit 0 **PATW1**: walking 1's pattern support
 Indicates whether the walking 1's pattern is supported as output over the trace port.
 1: supported

TPIU current test pattern/mode register (TPIU_CURTPM)

Address offset: 0x204

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

 Indicates whether continuous mode is enabled.
 0: disabled
 1: enabled

Bit 16 **PTIMEEN**: timed mode enable
 Indicates whether timed mode is enabled.
 0: disabled
 1: enabled

Bits 15:4 Reserved, must be kept at reset value.

Bit 3 **PATF0**: FF/00 pattern enable

Indicates whether the FF/00 pattern is enabled as output over the trace port.

- 0: disabled
- 1: enabled

Bit 2 **PATA5**: AA/55 pattern enable

Indicates whether the AA/55 pattern is enabled as output over the trace port.

- 0: disabled
- 1: enabled

Bit 1 **PATW0**: walking 0's pattern enable

Indicates whether the walking 0's pattern is enabled as output over the trace port.

- 0: disabled
- 1: enabled

Bit 0 **PATW1**: walking 1's pattern enable

Indicates whether the walking 1's pattern is enabled as output over the trace port.

- 0: disabled
- 1: enabled

TPIU test pattern repeat counter register (TPIU_TPRCR)

Address offset: 0x208

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16		
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.		
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	PATTCOUNT[7:0]									
								rw	rw	rw	rw	rw	rw	rw	rw		

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **PATTCOUNT[7:0]**: pattern number of TRACECLKIN cycles

8-bit counter value to indicate the number of TRACECLKIN cycles for which a pattern runs before it switches to the next pattern.

TPIU formatter and flush status register (TPIU_FFSR)

Address offset: 0x300

Reset value: 0x0000 0002

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TCPRESENT	FTSTOPPED	FLINPROG
													r	r	r

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **TCPRESENT**: TRACECTL output pin is availability
 Indicates whether the optional TRACECTL output pin is available for use.
 0: TRACECTL pin is not present in this device

Bit 1 **FTSTOPPED**: formatter stopped
 The formatter has received a stop request signal and all trace data and post-amble is sent. Any additional trace data on the ATB interface is ignored.
 0: formatter has not stopped
 1: formatter has stopped

Bit 0 **FLINPROG**: flush in progress
 Indicates whether a flush on the ATB slave port is in progress. This bit reflects the status of the AFVALIDS output. A flush can be initiated by the flush control bits in the TPIU_FFCR register.
 0: no flush in progress
 1: flush in progress

TPIU formatter and flush control register (TPIU_FFCR)

Address offset: 0x304

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	STOPTRIG	STOPFL	Res.	TRIGFL	TRIG EVT	TRIG IN	Res.	FONMAN	FONTRIG	FONFLIN	Res.	Res.	ENFCONT	ENFTC
		r/w	r/w		r/w	r/w	r/w		r/w	r/w	r/w			r/w	r/w

Bits 31:14 Reserved, must be kept at reset value.

Bit 13 **STOPTRIG**: stop on trigger event
 0: no effect
 1: stop formatter when a trigger event occurs

Bit 12 **STOPFL**: stop on flush
 0: no effect
 1: stop formatter when flush is completed

Bit 11 Reserved, must be kept at reset value.

Bit 10 **TRIGFL**: trigger on flush
 0: no effect
 1: indicates a trigger in the trace stream when flush is completed

Bit 9 **TRIG EVT**: trigger on trigger event
 0: no effect
 1: indicates a trigger in the trace stream when trigger event occurs

Bit 8 **TRIGIN**: trigger on trigger in
 0: no effect
 1: indicates a trigger in the trace stream when the TRIGIN input from the system CTI is asserted.

Bit 7 Reserved, must be kept at reset value.

Bit 6 **FONMAN**: generates a manual flush
 0: no effect
 1: flush the trace
 This bit is cleared automatically when the flush completes.

Bit 5 **FONTRIG**: flush on trigger event
 A trigger event occurs when the trigger counter reaches 0, or, if the trigger counter is 0, when the TRIGIN input from the system CTI is high.
 0: no effect
 1: flushes the trace if a trigger event occurs

Bit 4 **FONFLIN**: flush on flush in
 0: no effect
 1: flushes the trace if the FLUSHIN input from the system CTI is asserted

Bits 3:2 Reserved, must be kept at reset value.

Bit 1 **ENFCONT**: enables continuous formatting
 0: continuous formatting is disabled
 1: continuous formatting is enabled

Bit 0 **ENFTC**: enables the embedding of triggers in formatted trace
 0: formatting is disabled
 1: formatting is enabled

TPIU formatter synchronisation counter register (TPIU_FSCR)

Address offset: 0x308

Reset value: 0x0000 0040

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CYCCOUNT[4:0]				
											rw	rw	rw	rw	rw

Bits 31:5 Reserved, must be kept at reset value.

Bits 4:0 **CYCCOUNT[4:0]**: formatted frame number

Enables effective use of different sized TPAs without wasting large amounts of the storage capacity of the capture device.

This counter contains the number of formatter frames since the last synchronization packet of 128 bits. It is a 12-bit counter with a maximum count value of 4096. This equates to synchronization every 65536 bytes, that is, 4096 packets x 16 byte per packet. The default is set up for a synchronization packet every 1024 bytes, that is, every 64 formatter frames. If the formatter is configured for continuous mode, full and half-word sync frames are inserted during normal operation. Under these circumstances, the count value is the maximum number of complete frames between full synchronization packets.

TPIU claim tag set register (TPIU_CLAIMSET)

Address offset: 0xFA0

Reset value: 0x0000 000F

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CLAIMSET[3:0]				
													rw	rw	rw	rw

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **CLAIMSET[3:0]**: sets claim tag bits

Write:

- 0000: no effect
- xxx1: sets bit 0
- xx1x: sets bit 1
- x1xx: sets bit 2
- 1xxx: sets bit 3

Read:

- 0xF: indicates there are four bits in claim tag

TPIU claim tag clear register (TPIU_CLAIMCLR)

Address offset: 0xFA4

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CLAIMCLR[3:0]				
													rw	rw	rw	rw

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **CLAIMCLR[3:0]**: resets claim tag bits

Write:

- 0000: no effect
- xxx1: clears bit 0
- xx1x: clears bit 1
- x1xx: clears bit 2
- 1xxx: clears bit 3

Read:

- Returns current value of claim tag

TPIU lock access register (TPIU_LAR)

Address offset: 0xFB0

Reset value: 0xFFFF XXXX

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
ACCESS_W[31:16]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ACCESS_W[15:0]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w

Bits 31:0 **ACCESS_W[31:0]**: TPIU register write access enable

Enables write access to some TPIU registers by processor cores (debuggers do not need to unlock the component).

0xC5ACCE55: enable write access

Other values: disable write access

TPIU lock status register (TPIU_LSR)

Address offset: 0xFB4

Reset value: 0x0000 0003

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	LOCKTYPE	LOCKGRANT	LOCKEXIST
													r	r	r

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **LOCKTYPE**: TPIU_LAR register size
 Indicates the size of the TPIU_LAR register.
 0: 32-bit

Bit 1 **LOCKGRANT**: current lock status
 This bit always reads as zero by an external debugger.
 0: write access is permitted
 1: write access is blocked. Only reads are permitted.

Bit 0 **LOCKEXIST**: lock control existence
 Indicates whether a lock control mechanism exists. This bit always reads as zero by an external debugger.
 0: no lock control mechanism exists
 1: lock control mechanism is implemented

TPIU authentication status register (TPIU_AUTHSTAT)

Address offset: 0xFB8

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SNID[1:0]		SID[1:0]		NSNID[1:0]		NSID[1:0]	
								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:6 **SNID[1:0]**: security level for secure non-invasive debug
 0x0: not implemented

Bits 5:4 **SID[1:0]**: security level for secure invasive debug
 0x0: not implemented

Bits 3:2 **NSNID[1:0]**: security level for non-secure non-invasive debug
 0x0: not implemented

Bits 1:0 **NSID[1:0]**: security level for non-secure invasive debug
 0x0: not implemented

TPIU device configuration register (TPIU_DEVID)

Address offset: 0xFC8

Reset value: 0x0000 00A0

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	SWOUARTNRZ	SWOMAN	TCLKDATA	FIFOSIZE[2:0]			CLKRELAT	MAXNUM[4:0]				
				r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:12 Reserved, must be kept at reset value.

Bit 11 **SWOUARTNRZ**: Serial Wire Output, UART or NRZ support
 Indicates whether Serial Wire Output, UART or NRZ, is supported.
 0x0: not supported

Bit 10 **SWOMAN**: Serial Wire Output, Manchester support
 Indicates whether Serial Wire Output, Manchester encoded format, is supported.
 0x0: not supported

Bit 9 **TCLKDATA**: trace clock plus data support
 Indicates whether trace clock plus data is supported.
 0x0: not supported

Bits 8:6 **FIFOSIZE[2:0]**: FIFO size in powers of 2
 0x2: FIFO size = 4 (16 bytes)

Bit 5 **CLKRELAT**: ATB clock and TRACECLKIN sync
 Indicates the relationship between the ATB clock and TRACECLKIN (synchronous or asynchronous).
 0x1: asynchronous

Bits 4:0 **MAXNUM[4:0]**: number / type of ATB input port multiplexing
 0x0: none

TPIU device type identifier register (TPIU_DEVTYPE)

Address offset: 0xFCC

Reset value: 0x0000 0032

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SUBTYPE[3:0]				MAJORTYPE[3:0]			
								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **SUBTYPE[3:0]**: sub-classification
 0x1: trace port component

Bits 3:0 **MAJORTYPE[3:0]**: major classification
 0x1: trace sink component

TPIU CoreSight peripheral identity register 4 (TPIU_PIDR4)

Address offset: 0xFD0

Reset value: 0x0000 0004

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

66.10.7 Serial wire output (SWO)

The SWO is a CoreSight™ component that formats the trace stream from the Cortex®-M4 processor ITM and outputs it on the single wire TRACESWO output.

Compared to the TPIU, the SWO contains:

- no formatter
- no pattern generator
- an 8-bit ATB input
- no synchronous trace output (no TRACEDATA or TRACECLK pins)
- no support for flush
- no support for triggering

The SWO output supports Manchester encoded and UART NRZ formats.

For more information about the Serial Wire Output CoreSight™ component, refer to the *Arm® CoreSight™ Components Technical Reference Manual [4]*.

Serial wire output registers

SWO current output divisor register (SWO_CODR)

Address offset: 0x010

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	PRESCALER[12:0]												
			rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:13 Reserved, must be kept at reset value.

Bits 12:0 **PRESCALER[12:0]**: 13-bit counter pre-load value

This register allows to scale the baud rate of the SWO output. The baud rate is the trace clock frequency divided by (PRESCALER - 1).

Note: The baud rate changes instantly; it is recommended to stop the trace source and wait until the port is idle before writing this register.

SWO selected pin protocol register (SWO_SPPR)

Address offset: 0x0F0

Reset value: 0x0000 0001

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	PPROT[1:0]	
														rw	rw

Bits 31:2 Reserved, must be kept at reset value.

Bits 1:0 **PPROT[1:0]**: pin protocol

- 0x0: reserved
- 0x1: Manchester
- 0x2: NRZ
- 0x3: reserved

SWO formatter and flush status register (SWO_FFSR)

Address offset: 0x300

Reset value: 0x0000 0008

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	FTNONSTOP	TCPRESENT	FTSTOPPED	FLINPROG
												r	r	r	r

Bits 31:4 Reserved, must be kept at reset value.

Bit 3 **FTNONSTOP**: no need to stop formatter to change settings

- 1: formatter can not be stopped

- Bit 2 **TCPRESENT**: TRACECTL pin presence
0: TRACECTL pin is not present on SWO
- Bit 1 **FTSTOPPED**: formatter stopped
0: formatter stopping is not supported
- Bit 0 **FLINPROG**: flush in progress
0: flushing is not supported

SWO claim tag set register (SWO_CLAIMSET)

Address offset: 0xFA0

Reset value: 0x0000 000F

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CLAIMSET[3:0]			
												rw	rw	rw	rw

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **CLAIMSET[3:0]**: sets claim tag bits

Write:

- 0000: no effect
- xxx1: sets bit 0
- xx1x: sets bit 1
- x1xx: sets bit 2
- 1xxx: sets bit 3

Read:

- 0xF: indicates there are four bits in claim tag

SWO claim tag clear register (SWO_CLAIMCLR)

Address offset: 0xFA4

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CLAIMCLR[3:0]			
												rw	rw	rw	rw

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **CLAIMCLR[3:0]**: resets claim tag bits

Write:

- 0000: no effect
- xxx1: clears bit 0
- xx1x: clears bit 1
- x1xx: clears bit 2
- 1xxx: clears bit 3

Read:

- Returns current value of claim tag

SWO lock access register (SWO_LAR)

Address offset: 0xFB0

Reset value: 0xFFFF XXXX

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
ACCESS_W[31:16]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ACCESS_W[15:0]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w

Bits 31:0 **ACCESS_W[31:0]**: SWO register write access enable

Enables write access to some SWO registers by processor cores (debuggers do not need to unlock the component).

0xC5ACCE55: enable write access

Other values: disable write access

SWO lock status register (SWO_LSR)

Address offset: 0xFB4

Reset value: 0x0000 0003

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	LOCKTYPE	LOCKGRANT	LOCKEXIST
													r	r	r

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **LOCKTYPE**: SWO_LAR register size
 Indicates the size of the SWO_LAR register.
 0: 32-bit

Bit 1 **LOCKGRANT**: current lock status
 This bit always reads as zero by an external debugger.
 0: write access is permitted
 1: write access is blocked. Only reads are permitted.

Bit 0 **LOCKEXIST**: lock control existence
 Indicates whether a lock control mechanism exists. This bit always reads as zero by an external debugger.
 0: no lock control mechanism exists
 1: lock control mechanism is implemented

SWO authentication status register (SWO_AUTHSTAT)

Address offset: 0xFB8

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SNID[1:0]		SID[1:0]		NSNID[1:0]		NSID[1:0]	
								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:6 **SNID[1:0]**: security level for secure non-invasive debug
 0x0: not implemented

Bits 5:4 **SID[1:0]**: security level for secure invasive debug
 0x0: not implemented

Bits 3:2 **NSNID[1:0]**: security level for non-secure non-invasive debug
 0x0: not implemented

Bits 1:0 **NSID[1:0]**: security level for non-secure invasive debug
 0x0: not implemented

SWO device configuration register (SWO_DEVID)

Address offset: 0xFC8

Reset value: 0x0000 0EA0

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	SWOUARTNRZ	SWOMAN	TCLKDATA	FIFOSIZE[2:0]			CLKRELAT	MAXNUM[4:0]				
				r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:12 Reserved, must be kept at reset value.

Bit 11 **SWOUARTNRZ**: Serial Wire Output, UART or NRZ support
 Indicates whether Serial Wire Output, UART or NRZ, is supported.
 0x0: not supported

Bit 10 **SWOMAN**: Serial Wire Output, Manchester support
 Indicates whether Serial Wire Output, Manchester encoded format, is supported.
 0x0: not supported

Bit 9 **TCLKDATA**: trace clock plus data support
 Indicates whether trace clock plus data is supported.
 0x0: not supported

Bits 8:6 **FIFOSIZE[2:0]**: FIFO size in powers of 2
 0x2: FIFO size = 4 (16 bytes)

Bit 5 **CLKRELAT**: ATB clock and TRACECLKIN synchronization
 Indicates the relationship between the ATB clock and TRACECLKIN (synchronous or asynchronous).
 0x1: asynchronous

Bits 4:0 **MAXNUM[4:0]**: number / type of ATB input port multiplexing
 0x0: none

SWO device type identifier register (SWO_DEVTYPE)

Address offset: 0xFCC

Reset value: 0x0000 0011

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SUBTYPE[3:0]			MAJORTYPE[3:0]				
								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **SUBTYPE[3:0]**: sub-classification
 0x1: trace port component

Bits 3:0 **MAJORTYPE[3:0]**: major classification
 0x1: trace sink component

SWO CoreSight peripheral identity register 4 (SWO_PIDR4)

Address offset: 0xFD0

Reset value: 0x0000 0004

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SIZE[3:0]				JEP106CON[3:0]			
								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **SIZE[3:0]**: register file size

0x0: register file occupies a single 4-Kbyte region

Bits 3:0 **JEP106CON[3:0]**: JEP106 continuation code

0x4: Arm® JEDEC code

SWO CoreSight peripheral identity register 0 (SWO_PIDR0)

Address offset: 0xFE0

Reset value: 0x0000 0014

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	PARTNUM[7:0]							
								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **PARTNUM[7:0]**: part number bits [7:0]

0x14: SWO part number

SWO CoreSight peripheral identity register 1 (SWO_PIDR1)

Address offset: 0xFE4

Reset value: 0x0000 00B9

66.10.8 System trace macrocell (STM)

The System Trace Macrocell is a CoreSight™ component which allows instrumentation data generated by software to be incorporated in the trace output. The software writes the instrumentation data to the STM via a memory-mapped port on the AXI system interconnect. The data is formatted and time-stamped for output on the ATB trace bus, where it is merged with the trace coming from other sources (ETM, ITM).

Figure 829. System Trace Macrocell

The STM is configured with the following values:

- DATA_FIFO_DEPTH = 16
- CHN_FIFO_DEPTH = 8
- HW_EVOBIF_PRESENT = TRUE
- AXI_ID_WIDTH = 11

The various AXI masters can generate trace by writing to the extended stimulus ports of the STM via its AXI slave port, which is mapped in a 16-Mbyte window of address space (see memory map). A 256-byte extended stimulus port comprises 16 x 64-bit locations or registers. Writes to different locations generate different types of trace packets, as shown in [Table 593](#). The base address for stimulus port n is the STM base address + n x 256. A master can use any number of the 65536 available stimulus ports mapped in the 16 Mbyte-window.

Table 593. STM extended stimulus port memory map

Address offset	Name	Description
0x00	G_DMTS	Data, marked with timestamp, guaranteed
0x08	G_DM	Data, marked, guaranteed
0x10	G_DTS	Data, with timestamp, guaranteed
0x18	G_D	Data, guaranteed
0x20-0x58	-	Reserved

Table 593. STM extended stimulus port memory map (continued)

Address offset	Name	Description
0x60	G_FLAGTS	Flag with timestamp, guaranteed
0x68	G_FLAG	Flag, guaranteed
0x70	G_TRIGTS	Trigger with timestamp, guaranteed
0x78	G_TRIG	Trigger, guaranteed
0x80	I_DMTS	Data, marked with timestamp, invariant timing
0x88	I_DM	Data, marked, invariant timing
0x90	I_DTS	Data, with timestamp, invariant timing
0x98	I_D	Data, invariant timing
0xA0 to 0xD8	-	Reserved
0xE0	I_FLAGTS	Flag with timestamp, invariant timing
0xE8	I_FLAG	Flag, invariant timing
0xF0	I_TRIGTS	Trigger with timestamp, invariant timing
0xF8	I_TRIG	Trigger, invariant timing

The trace packets contain the 8-bit identity of the master that triggered them. This identity is decoded from the non-secure master ID (NSAID) carried on the AWUSER wires of the AXI interconnect, together with the AWID signals which identify which of the two Cortex[®]-A7 CPU cores performed the write. The ID also includes the security status of the master at the time.

The ID is mapped as follows:

- Bit [7] = 0
- Bit [6] = secure/non-secure state
- Bit [5:0] = master ID

A list of valid IDs and how they map to the originating master is given in [Table 594](#).

Table 594. STM trace packet ID mapping to AXI masters

Master	Secure access ID	Non-secure access ID
Cortex [®] -A7 CPU1	0x00	0x40
Cortex [®] -A7 CPU2	0x01	0x41
Cortex [®] -M4	0x02	0x42
MDMA	0x0A	0x4A
DMA1/2	-	0x4C
DAP	0x1E	0x5E

The STM can also generate trace packets or triggers when certain hardware events are detected. A maximum of 64 events can be traced at any one time. An external multiplexer allows four sets of signals to be mapped onto these events. The mapping is given in [Table 595](#) and [Table 596](#). All events are edge sensitive.

Table 595. Hardware event mapping 0 to 3

Key: sreq = DMA request; irq = interrupt request; ↑ = active going; ↓ = inactive going

For more information on the System Trace Macrocell, refer to the *Arm® CoreSight™ STM-500 Technical Reference Manual [8]*.

STM registers

The STM is configured and controlled by registers mapped on the debug APB, accessed by the debugger at STMBaseAddress = 0xE00A 0000, and by software at STMBaseAddress = 0x500A 0000.

System trace macrocell registers

STM hardware event enable register (STM_HEER)

Address offset: 0xD00

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
HEE[31:16]															
r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
HEE[15:0]															
r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w

Bits 31:0 **HEE[31:0]**: hardware event enable

HEE is used to enable hardware events to generate trace. The register defines one bit per hardware event.

- 0: hardware event disabled
- 1: hardware event enabled

STM hardware event trigger enable register (STM_HETER)

Address offset: 0xD20

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
HETE[31:16]															
r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
HETE[15:0]															
r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w

Bits 31:0 **HETE[31:0]**: trigger generation enable

HETE is a bit mask used to enable trigger generation on hardware events. The register defines one bit per hardware event.

- 0: disabled
- 1: enabled

STM hardware event bank select register (STM_HEBSR)

Address offset: 0xD60

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	HEBS
															rw

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **HEBS**: hardware event bank selector

HEBS is used to select the bank of 32 hardware events to control, see [Table 595: Hardware event mapping 0 to 3](#)).

- 0: bank 0
- 1: bank 1

STM hardware event main control register (STM_HEMCR)

Address offset: 0xD64

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ATBTRIGEN	TRIGCLEAR	TRIGSTATUS	TRIGCTL	Res.	ERRDETECT	COMPEN	EN
								rw	rw	r	rw		r	rw	rw

Bits 31:8 Reserved, must be kept at reset value.

Bit 7 **ATBTRIGEN**: ATB trace trigger enable

When set, this bit enables the STM to use the ATID value of 0x7D when a trigger event on match using STMHETER occurs.

- 0: do not output ATB trace triggers
- 1: use ATB trace triggers

Bit 6 **TRIGCLEAR**: clear trigger status

When TRIGCTL indicates single-shot mode, this bit is used to clear TRIGSTATUS. Writing a 1 to this bit when in multi-shot mode is unpredictable.

- 0: no effect
- 1: clears TRIGSTATUS if TRIGSTATUS is 1

Bit 5 **TRIGSTATUS**: trigger status

When TRIGCTL indicates single-shot mode, this indicates whether the single trigger has occurred.

- 0: trigger has not occurred
- 1: trigger has occurred

Bit 4 **TRIGCTL**: trigger control

- 0: triggers are multi-shot
- 1: triggers are single-shot

Bit 3 **Reserved**, must be kept at reset value.

Bit 2 **ERRDETECT**: error detection
 Enable error detection on the hardware event tracing.
 0: error detection disabled
 1: error detection enabled.

Bit 1 **COMPEN**: compression enable
 Enable leading zero suppression of hardware event data values in the trace stream.
 0: compression disabled
 1: compression enabled.

Bit 0 **EN**: enable hardware event tracing
 0: disabled
 1: enabled

STM hardware event external multiplex control register (STM_HEEXTMUXR)

Address offset: 0xD68

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	EXTMUX[7:0]							
								rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:8 **Reserved**, must be kept at reset value.

Bits 7:0 **EXTMUX[7:0]**: signals for events selector
 Selects the signals to be mapped onto the 64 hardware events that can be traced by the STM (refer to [Table 595](#) and [Table 596](#)).

STM hardware event master number register (STM_HEMASTR)

Address offset: 0xDF4

Reset value: 0x0000 0080 (0x0000 FFFF)

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MASTER[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **MASTER[15:0]**: STPv2 master number

Indicates the STPv2 master number of hardware event trace. This number is the master number presented in STPv2.

0x80: hardware events are associated with master 0x80

Others: reserved

STM hardware event features 1 register (STM_HEFEAT1R)

Address offset: 0xDF8

Reset value: 0x3020 0035

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	HEEXTMUXSIZE[2:0]			Res.	Res.	Res.	Res.	NUMHE[8:1]							
	r	r	r					r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
NUMHE[0]	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	HECOMP[1:0]		HEMASTR	HEERR	Res.	HETER
r										r	r	r	r		r

Bit 31 Reserved, must be kept at reset value.

Bits 30:28 **HEEXTMUXSIZE[2:0]**: EXTMUX bit field size

Indicates the size of the EXTMUX bit field of register STM_HEEXTMUXR.

0x3: 8-bit wide (up to 256 multiplexers)

Others: reserved

Bits 27:24 Reserved, must be kept at reset value.

Bits 23:15 **NUMHE[8:0]**: number of hardware events supported by the STM

0x40: 64 hardware events

Bits 14:6 Reserved, must be kept at reset value.

Bits 5:4 **HECOMP[1:0]**: data compression on hardware event tracing support

0x3: data compression support is programmable. The COMPEN bit of register STM_HEMCR is implemented.

Bit 3 **HEMASTR**: STMHEMASTR support

0: STMHEMASTR is read-only

Bit 2 **HEERR**: hardware event error detection support.

1: hardware event error detection implemented. The ERRDETECT bit of register STM_HEMCR is implemented.

Bit 1 Reserved, must be kept at reset value.

Bit 0 **HETER**: STM_HETER support

1: STM_HETER implemented.

STM hardware event features ID register (STM_HEIDR)

Address offset: 0xDFC

Reset value: 0x0000 0011

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	VENDSPEC[3:0]				CLASSREV[3:0]				CLASS[3:0]			
				r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:12 Reserved, must be kept at reset value.

Bits 11:8 **VENDSPEC[3:0]**: vendor specific

Identifies any vendor specific modifications or mappings.
 0: vendor specific information
 Others: reserved

Bits 7:4 **CLASSREV[3:0]**: programmer model revision

Identifies the revision of the programmer model.
 1: revision
 Others: reserved

Bits 3:0 **CLASS[3:0]**: programmer model

Identifies the programmers model.
 1: hardware event control
 Others: reserved

STM stimulus port enable register (STM_SPER)

Address offset: 0xE00

Reset value: 0x0000 0000

This read/write only register is used to enable the stimulus registers to generate trace. The register defines one bit per stimulus register. Writing 1 enables the appropriate stimulus port, writing 0 disables the appropriate stimulus port. This register is used in conjunction with the Software Enable Bank Select Register.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
SPE[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SPE[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **SPE[31:0]**: stimulus port enable

This register is used to enable the stimulus registers to generate trace. It defines one bit per stimulus register. Writing 1 enables the appropriate stimulus port, writing 0 disables the appropriate stimulus port. This register is used in conjunction with the Software Enable Bank Select Register.

0: stimulus port disabled
 1: stimulus port enabled

STM stimulus port trigger enable register (STM_SPTER)

Address offset: 0xE20

Reset value: 0x0000 0000

This register is used to enable trigger generation on writes to enabled stimulus port registers.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
SPTER[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

SPTER[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **SPTER[31:0]**: trigger generation trigger generation bit mask

This register is a bit mask used to enable trigger generation on writes to enabled stimulus port registers. It defines one bit per stimulus port register.

0: disabled

1: enabled

STM stimulus port select configuration register (STM_SPSCR)

Address offset: 0xE60

Reset value: 0x0000 0000

This register allows a debugger to program which stimulus ports the STM_SPER and STM_SPTER registers apply to.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
PORTSEL[11:0]												Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	PORTCTL[1:0]	
														rw	rw

Bits 31:20 **PORTSEL[11:0]**: stimulus port selector

Defines which stimulus ports the STM_SPTER and/or STM_SPER registers apply to.

Bits 19:2 Reserved, must be kept at reset value.

Bits 1:0 **PORTCTL[1:0]**: port selection control mode

Defines how the port selection is applied.

0x0: port selection not used

0x1: port selection applies only to the STM_SPTER register

0x2: reserved

0x3: port selection applies to both the STM_SPER and STM_SPTER

STM stimulus port master select configuration register (STM_SPMSCR)

Address offset: 0xE64

Reset value: 0x0000 0000

This register allows a debugger to program which masters the STM_SPSCR register applies to.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

MASTSEL[0]	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	MASTCTL
rw															rw

Bits 31:23 Reserved, must be kept at reset value.

Bits 22:15 **MASTSEL[7:0]**:master select

This field defines which master the STM_SPSCR register applies to.

Bits 14:1 Reserved, must be kept at reset value.

Bit 0 **MASTCTL**: master control mode

Defines how the master is applied.

0: master selection not used

1: port selection applies to the STM_SPSCR register

STM stimulus port override control register (STM_SPOVERRIDER)

Address offset: 0xE68

Reset value: 0x0000 0000

This register allows a debugger to override various features of the STM.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

PORTSEL[0]	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	OVERTS	OVERTL[1:0]	
rw													rw	rw	rw

Bits 31:15 **PORTSEL[16:0]**: port override select

Defines which stimulus ports the override controls apply to.

Bits 14:3 Reserved, must be kept at reset value.

Bit 2 **OVERTS**: override timestamp request

This override requests all stimulus port writes that cause trace to be traced with a timestamp (when possible). As with normal operation, this does not ensure that all packets are generated with timestamps. This field is independent from OVERCTL and PORTSEL.

- 0: override not enabled
- 1: override enabled

Bits 1:0 **OVERCTL[1:0]**: override control mode

Defines how port selection is applied.

- 0x0: override controls disabled
- 0x1: ports selected by PORTSEL always behave as guaranteed transactions
- 0x2: ports selected by PORTSEL always behave as invariant timing transactions
- 0x3: reserved

STM stimulus port master override control register (STM_SPMOVERRIDE)

Address offset: 0xE6C

Reset value: 0x0000 0000

This register allows a debugger to select which masters the STM_SPOVERRIDE applies to.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	MASTSEL[7:1]						
									rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MASTSEL[0]	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	MASTCTL
	rw														

Bits 31:23 Reserved, must be kept at reset value.

Bits 22:15 **MASTSEL[7:0]**: master port override selection

This field defines which master ports the override controls apply to. The size of this field is defined by the number of implemented masters.

Bits 14:1 Reserved, must be kept at reset value.

Bit 0 **MASTCTL**: master selection control mode

Defines how the master selection is applied.

- 0: override controls disabled. STM_SPOVERRIDE applies equally to all masters.
- 1: master selection enabled. STM_SPOVERRIDE applies to the masters selected by MASTSEL.

STM stimulus port trigger control and status register (STM_SPTRIGCSR)

Address offset: 0xE70

Reset value: 0x0000 0000

This register is used to control the STM triggers induced by STM_SPTER.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ATBTRIGEN_DIR	ATBTRIGEN_TE	TRIGCLEAR	TRIGSTATUS	TRIGCTL
											r/w	r/w	w	r	r/w

Bits 31:5 Reserved, must be kept at reset value.

Bit 4 **ATBTRIGEN_DIR**: ATB trace on write to TRIG

When set, this bit enables the STM to use the ATID value of 0x7D when a trigger event on writes to TRIG location occurs.

0: does not output ATB trace triggers on write to TRIG location

1: outputs ATB trace trigger for trigger on write to TRIG location

Bit 3 **ATBTRIGEN_TE**: ATB trace trigger output

When set, this bit enables the STM to use the ATID value of 0x7D when a trigger event on match using STM_SPTER occurs.

0: does not output ATB trace trigger for trigger on match using STM_SPTER

1: outputs ATB trace trigger for trigger on match using STM_SPTER

Bit 2 **TRIGCLEAR**: trigger status clear

When bit TRIGCTL indicates single-shot mode, TRIGCLEAR is used to clear TRIGSTATUS. Writing a 1 to this bit when in multi-shot mode is leads to unpredictable behavior.

0: no effect

1: clears TRIGSTATUS if TRIGSTATUS is 1

Bit 1 **TRIGSTATUS**: trigger status

When bit TRIGCTL indicates single-shot mode, TRIGSTATUS indicates whether the single trigger has occurred.

0: trigger has not occurred

1: trigger has occurred

Bit 0 **TRIGCTL**: trigger control

0: triggers are multi-shot

1: triggers are single-shot

STM trace control and status register (STM_TCSR)

Address offset: 0xE80

Reset value: 0x0000 0004

Controls STM settings.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	BUSY	TRACEID[6:0]

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	COMPEN	Res.	Res.	SYNCEN	TSEN	EN
										rw			r	rw	rw

Bits 31:24 Reserved, must be kept at reset value.

Bit 23 **BUSY**: STM busy

Indicates if the STM is busy, for example because STM trace FIFO is not empty.

0: STM is not busy

1: STM is busy.

Bits 22:16 **TRACEID[6:0]**: ATB Trace ID

Bits 15:6 Reserved, must be kept at reset value.

Bit 5 **COMPEN**: compression enable for stimulus ports

0: compression disabled, data transfers are transmitted at the size of the transaction

1: compression enabled, data transfers are compressed to save bandwidth

Bits 4:3 Reserved, must be kept at reset value.

Bit 2 **SYNCEN**: STM_SYNCR implementation

STM_SYNCR is implemented; this value is RAO.

1: STM_SYNCR implemented

Bit 1 **TSEN**: timestamp requests enable

This bit controls if timestamp requests are ignored or taken into account.

0: timestamping disabled. Requests for timestamp generation are ignored, and stimulus port writes selecting timestamping are treated as if it were not selected.

1: timestamping enabled. If stimulus writes select timestamping, a timestamp is output according to STPv2.

Bit 0 **EN**: global STM enable

0: STM disabled

1: STM enabled

STM timestamp stimulus register (STM_TSSTIMR)

Address offset: 0xE84

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	FORCETS
															w

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **FORCETS**: force timestamp stimulus

A write to register STM_TSSTIMR with bit FORCETS as 1 requests the next stimulus port write which causes trace to be upgraded to have a timestamp. Writes with this bit as 0 are ignored.

1: force timestamp stimulus

STM timestamp frequency register (STM_TSFREQR)

Address offset: 0xE8C

Reset value: 0x0000 0000

This register is used to indicate the frequency of the timestamp counter. The unit of measurement is increments per second. When the STPv2 protocol is used, this register contains the value output in the `FREQ` and `FREQ_TS` packets. The timestamp frequency is output in the STPv2 protocol at every synchronization point when bit `TSEN` `STM_TCSR` is 1.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

FREQ[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **FREQ[31:0]**: timestamp frequency

Indicates the frequency of the timestamp counter in Hz.

STM synchronization control register (STM_SYNCR)

Address offset: 0xE90

Reset value: 0x0000 0000

This register controls the interval between synchronization packets as a function of the number of bytes of trace generated. This register only provides a hint of the desired synchronization frequency since implementations are permitted to be inaccurate. Writing a value of 0x0000 0000 to this register disables the synchronization counter however any other implementation defined synchronization mechanism continues to operate independently (refer to register [STM auxiliary control register \(STM_AUXCR\)](#)).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
Res.	Res.	Res.	MODE	COUNT[8:0]										Res.	Res.	Res.
			rw	rw	rw	rw	rw	rw	rw	rw	rw	rw				

Bits 31:13 Reserved, must be kept at reset value.

Bit 12 **MODE**: mode control

0: COUNT[8:0] defines a value N. Synchronization period is 8 x N bytes.

1: COUNT[8:4] defines a value N. Synchronization period is 2^N bytes. N must be in the range of 0d12 to 0d27 inclusive; other values lead to unpredictable results.

Bits 11:3 **COUNT[8:0]**: number of bytes between synchronization packets

Indicates the counter value for the number of bytes between synchronization packets. Reads return the value of this register.

Bits 2:0 Reserved, must be kept at reset value.

STM auxiliary control register (STM_AUXCR)

Address offset: 0xE94

Reset value: 0x0000 0000

This register is used for implementation defined STM controls.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	QHWEVOVERRIDE	Res.	Res.	Res.	Res.	PRIORINVDIS	ASYNCPE	FIFOAF
								rw					rw	rw	rw

Bits 31:8 Reserved, must be kept at reset value.

Bit 7 **QHWEVOVERRIDE**: override control for the Q-Channels

0: no override. Q-Channel is able to accept a quiescence request when hardware event tracing is enabled.

1: override. Q-Channel denies a quiescence request when hardware event tracing is enabled.

Bits 6:3 Reserved, must be kept at reset value.

Bit 2 **PRIORINVDIS**: AXI vs. HW flush arbitration

Controls arbitration between AXI and HW during flush.

0: priority inversion. When AXI flush is finished, HW gets priority until HW flush is done.

1: priority inversion disabled. AXI always has priority over HW.

Bit 1 **ASYNCPE**: ASYNC priority

0: ASYNC priority is always lower than trace

1: ASYNC priority increases on second synchronization request

Bit 0 **FIFOAF**: auto-flush

0: auto-flush disabled

1: auto-flush enabled

STM features 1 register (STM_FEAT1R)

Address offset: 0xEA0

Reset value: 0x0065 87D1

This register indicates the features of the STM in conjunction with registers STM_FEAT2R and STM_FEAT3R.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SWOEN[1:0]		SYNCEN[1:0]		HWTEN[1:0]		TSPRESCALE[1:0]	
								r	r	r	r	r	r	r	r

r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:22 **SWOEN[1:0]**: SWOEN support
 Support of bit SWOEN of register STM_TCSR.
 0x1: bit SWOEN of register STM_TCSR is not implemented

Bits 21:20 **SYNCEN[1:0]**: SYNCEN support
 Support of bit SYNCEN of register STM_TCSR.
 0x2: bit SYNCEN of register STM_TCSR is implemented but always reads as 1

Bits 19:18 **HWTEN[1:0]**: HWTEN support
 Support of bit HWTEN of register STM_TCSR.
 0x1: bit HWTEN of register STM_TCSR is not implemented

Bits 17:16 **TSPRESCALE[1:0]**: timestamp prescale support
 0x1: timestamp prescale not implemented

Bits 15:14 **TRIGCTL[1:0]**: trigger control support
 0x2: multi-shot and single-shot triggers supported. STM_TRIGCSR is implemented.

Bits 13:10 **TRACEBUS[3:0]**: trace bus support
 0x1: CoreSight™ ATB plus ATB trigger support implemented. Field TRACEID of register STM_TCSR, and bits ATBTRIGEN_DIR and ATBTRIGEN_TE of register STM_SPTRIGCSR are implemented.

Bits 9:8 **SYNC[1:0]**: STM_SYNCR support
 0x3: STM_SYNCR implemented with MODE control

Bit 7 **FORCETS**: STM_TSSTIMR support
 1: bit FORCETS of register STM_TSSTIMR is implemented

Bit 6 **TSFREQ**: Timestamp frequency indication configuration
 1: STM_TSFREQR is read-write

Bits 5:4 **TS[1:0]**: Timestamp support
 0x1: absolute timestamps implemented

Bits 3:0 **PROT[3:0]**: Protocol
 0x1: STPv2 protocol

STM features 2 register (STM_FEAT2R)

Address offset: 0xEA4

Reset value: 0x0001 14F2

This register indicates the features of the STM in conjunction with registers STM_FEAT1R and STM_FEAT3R.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SPTYPE[1:0]

r	r	r	r		r	r	r	r	r	r	r		r	r	r

Bits 31:18 Reserved, must be kept at reset value.

Bits 17:16 **SPTYPE[1:0]**: stimulus port type support
 0x1: only extended stimulus ports implemented

Bits 15:12 **DSIZE[3:0]**: fundamental data size
 0x1: 64-bit data

Bit 11 Reserved, must be kept at reset value.

Bits 10:9 **SPTRTYPE[1:0]**: stimulus port transaction type support
 0x2: both invariant timing and guaranteed transactions are supported

Bits 8:7 **PRIVMASK[1:0]**: STM_PRIVMASKR support
 0x1: STM_PRIVMASKR is not implemented

Bit 6 **SPOVERRIDE**: STM_OVERRIDER support
 1: STM_SPOVERRIDER and STM_SPMOVERRIDER are implemented

Bits 5:4 **SPCOMP[1:0]**: data compression on stimulus ports support
 0x3: data compression support is programmable. Bit COMPEN of register STM_TCSR is implemented.

Bit 3 Reserved, must be kept at reset value.

Bit 2 **SPER**: STM_SPER presence
 0: STM_SPER is implemented

Bits 1:0 **SPTER[1:0]**: STM_SPTER support
 0x2: STM_SPTER is implemented

STM features 3 register (STM_FEAT3R)

Address offset: 0xEA8

Reset value: 0x0000 007F

This register indicates the features of the STM in conjunction with registers STM_FEAT1R and STM_FEAT2R.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

												w	w	w	w

Bits 31:4 Reserved, must be kept at reset value.

- Bit 3 **ASYNCOUT_W**: sets the value of the ASYNCOUT output in integration mode
 - 1: drives logic 1 on ASYNCOUT output
 - 0: drives logic 0 on ASYNCOUT output
- Bit 2 **TRIGOUTHETE_W**: sets the value of the TRIGOUTHETE output in integration mode
 - 1: drives logic 1 on TRIGOUTHETE output
 - 0: drives logic 0 on TRIGOUTHETE output
- Bit 1 **TRIGOUTSW_W**: sets the value of the TRIGOUTSW output in integration mode
 - 1: drives logic 1 on TRIGOUTSW output
 - 0: drive logic 0 on TRIGOUTSW output
- Bit 0 **TRIGOUTSPTE_W**: sets the value of the TRIGOUTSPTE output in integration mode
 - 1: drives logic 1 on TRIGOUTSPTE output
 - 0: drives logic 0 on TRIGOUTSPTE output

STM integration mode ATB data 0 register (STM_ITATBDATA0)

Address offset: 0xEEC

Reset value: 0x0000 0000

This register controls the value of the ATDATAM output in integration mode.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

							w	w	w	w	w	w	w	w	w

Bits 31:9 Reserved, must be kept at reset value.

Bit 8 **ATDATAM63_W**: sets the value of the ATDATAM[63] output
 1: drives logic 1 on ATDATAM[63] output
 0: drives logic 0 on ATDATAM[63] output

Bit 7 **ATDATAM55_W**: sets the value of the ATDATAM[55] output
 1: drives logic 1 on ATDATAM[55] output
 0: drives logic 0 on ATDATAM[55] output

Bit 6 **ATDATAM47_W**: sets the value of the ATDATAM[47] output
 1: drives logic 1 on ATDATAM[47] output
 0: drives logic 0 on ATDATAM[47] output

Bit 5 **ATDATAM39_W**: sets the value of the ATDATAM[39] output
 1: drives logic 1 on ATDATAM[39] output
 0: drives logic 0 on ATDATAM[39] output

Bit 4 **ATDATAM31_W**: sets the value of the ATDATAM[31] output
 1: drives logic 1 on ATDATAM[31] output
 0: drives logic 0 on ATDATAM[31] output

Bit 3 **ATDATAM23_W**: sets the value of the ATDATAM[23] output
 1: drives logic 1 on ATDATAM[23] output
 0: drives logic 0 on ATDATAM[23] output

Bit 2 **ATDATAM15_W**: sets the value of the ATDATAM[15] output
 1: drives logic 1 on ATDATAM[15] output
 0: drives logic 0 on ATDATAM[15] output

Bit 1 **ATDATAM7_W**: sets the value of the ATDATAM[7] output
 1: drives logic 1 on ATDATAM[7] output
 0: drives logic 0 on ATDATAM[7] output

Bit 0 **ATDATAM0_W**: sets the value of the ATDATAM[0] output
 1: drives logic 1 on ATDATAM[0] output
 0: drives logic 0 on ATDATAM[0] output

STM integration mode ATB control 2 register (STM_ITATBCTR2)

Address offset: 0xEF0

Reset value: 0x0000 0000

This register returns the value of the ATREADYM and AFVALIDM inputs in integration mode.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	AFVALIDM_R	ATREADYM_R
														r	r

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **AFVALIDM_R**: reads the value of the AFVALIDM input

- 1: pin is at logic 1
- 0: pin is at logic 0

Bit 0 **ATREADYM_R**: reads the value of the ATREADYM input

- 1: pin is at logic 1
- 0: pin is at logic 0

STM integration mode ATB identification register (STM_ITATBID)

Address offset: 0xEF4

Reset value: 0x0000 0000

This register controls the value of the ATIDM output in integration mode.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ATIDM_W[6:0]						
									w	w	w	w	w	w	w

Bits 31:7 Reserved, must be kept at reset value.

Bits 6:0 **ATIDM_W[6:0]**: sets the value of the ATIDM output

STM integration mode ATB control 0 register (STM_ITATBCTR0)

Address offset: 0xEF8

Reset value: 0x0000 0000

This register controls the value of the ATVALIDM, AFREADYM, and ATBYTESM outputs in integration mode.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

					w	w	w							w	w

Bits 31:11 Reserved, must be kept at reset value.

Bits 10:8 **ATBYTESM_W[2:0]**: sets the value of the ATBYTESM output

- 0x7: drives logic 111 on the ATBYTESM output
- 0x6: drives logic 110 on the ATBYTESM output
- 0x5: drives logic 101 on the ATBYTESM output
- 0x4: drives logic 100 on the ATBYTESM output
- 0x3: drives logic 11 on the ATBYTESM output
- 0x2: drives logic 10 on the ATBYTESM output
- 0x1: drives logic 01 on the ATBYTESM output
- 0x0: drives logic 00 on the ATBYTESM output

Bits 7:2 Reserved, must be kept at reset value.

Bit 1 **AFREADYM_W**: sets the value of the AFREADYM output

- 1: drives logic 1 on the AFREADYM output
- 0: drives logic 0 on the AFREADYM output

Bit 0 **ATVALIDM_W**: sets the value of the ATVALIDM output

- 1: drives logic 1 on the ATVALIDM output
- 0: drives logic 0 on the ATVALIDM output

STM integration mode control register (STM_ITCTRL)

Address offset: 0xF00

Reset value: 0x0000 0000

This register is used to enable topology detection. Refer to *CoreSight™ Architecture Specification* for more information. This register enables the component to switch between functional mode and integration mode. The default behavior is functional mode. In integration mode the inputs and outputs of the STM can be directly controlled for integration testing and topology solving.

Note: When a device has been in integration mode, it might not function with the original behavior. After performing integration or topology detection, the system must be reset to ensure correct behavior of CoreSight™ and other connected system components that are affected by the integration or topology detection.

															rw

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **IME**: component mode switch enable

Enables the component to switch between functional mode and integration mode.

1: enables integration mode

0: disables integration mode

STM claim tag set register (STM_CLAIMSET)

Address offset: 0xFA0

Reset value: 0x0000 000F

This register is used in conjunction with the Claim Tag Clear register (STM_CLAIMCLR). This register forms one half of the claim tag value. This location allows individual bits to be set (write) and returns the number of bits that can be set (read).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

												rw	rw	rw	rw

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **SET[3:0]**: claim tag bit implementation

0xF: claim tag bits are present within the claim tag field

STM claim tag clear register (STM_CLAIMCLR)

Address offset: 0xFA4

Reset value: 0x0000 0000

This register is used in conjunction with the Claim Tag Set register (STM_CLAIMSET). This register forms one half of the claim tag value. This location enables individual bits to be cleared (write) and returns the current claim tag value (read).

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **CLR[3:0]**: claim tag current setting

STM lock access register (STM_LAR)

Address offset: 0xFB0

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
KEY[31:16]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w

KEY[15:0]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w

Bits 31:0 **KEY[31:0]**: device register write access enable

A write of 0xC5ACCE55 enables further write access to the device. An invalid write has the effect of removing write access.

0xC5ACCE55: unlocks the protection register to enable write access

STM lock status register (STM_LSR)

Address offset: 0xFB4

Reset value: 0x0000 0003

This register indicates the status of the lock control mechanism that prevents accidental writes by the code under debug. The lock mechanism does not impact accesses to the extended stimulus port registers. This register is needed even in the absence of any lock access control mechanism. Where it is present and locked, the lock mechanism blocks the write accesses to any register but the STM_LAR. The lock mechanism is only present for accesses with PADDRDBG31 signal low.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	NTT	SLK	SLI
													r	r	r

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **NTT**: STM_LAR size indicator

Indicates if the STM implements the STM_LAR as 8-bit or 32-bit.
 0: 32-bit

Bit 1 **SLK**: lock current status

0: enables write access to the STM. For read accesses to the STM_LSR when the PADDRDBG31 signal is high, this bit is always 0.
 1: blocks write access to the STM. The STM ignores all write accesses to the registers when the PADDRDBG31 signal is low. Reads are permitted.

Bit 0 **SLI**: lock control mechanism existence

Indicates that a lock control mechanism exists for this device.
 0: no lock control mechanism exists. The STM ignores writes to the STM_LAR. For read accesses to the STM_LSR when the PADDRDBG31 signal is high, this bit is always 0.
 1: lock control mechanism is present. For read accesses to the STM_LSR when the PADDRDBG31 signal is low, this bit is always 1.

STM authentication status register (STM_AUTHSTATUS)

Address offset: 0xFB8

Reset value: 0x0000 00AA

This register reports the required security level and current status of the authentication interface.

0x2: disabled
 0x3: enabled

STM device architecture register (STM_DEVARCH)

Address offset: 0xFBC

Reset value: 0x4771 0A63

This register indicates the architect and architecture of the STM. For the STM-500, the architect is Arm®, and the architecture is STMv1.1.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
ARCHITECT[10:0]											PRESENT	REVISION[3:0]

Res.	ARCHID[14:0]														
	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:21 **ARCHITECT[10:0]**: component architect

Defines the architect of the component. Bits[31:28] indicate the DEP106 continuation code of the architect. Bits[27:21] indicate the JEP106 identification code of the architect. Refer to the Standard Manufacturers Identification Code for information about JEP106.

0x23B: the architect of the STM-500 is Arm®

Bit 20 **PRESENT**: STM_DEVARCH register presence

1: the STM_DEVARCH register is present

Bits 19:16 **REVISION[3:0]**: architecture revision

Returns the revision of the architecture that the ARCHID field specifies. For the STM-500, this value is 0x1, indicating the STMv1.1 architecture.

0x1: STMv1.1 architecture

Bit 15 Reserved, must be kept at reset value.

Bits 14:0 **ARCHID[14:0]**: architecture ID

Returns a value that identifies the architecture of the component. For the STM-500, this value is 0x0A63, indicating the STMv1 architecture.

0x0A63: STMv1 architecture

STM device configuration register (STM_DEVID)

Address offset: 0xFC8

Reset value: 0x0001 0000

This register indicates the capabilities of the CoreSight™ STM.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bits 31:17 Reserved, must be kept at reset value.

Bits 16:0 **NUMSP[16:0]**: number of stimulus ports implemented

0x10000: 65 536 stimulus ports are implemented

STM device type identifier register (STM_DEVTYPE)

Address offset: 0xFCC

Reset value: 0x0000 0063

This register provides a debugger with component information when the part number is not recognized. The debugger can then report this information.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SUB[3:0]				MAJOR[3:0]			
								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **SUB[3:0]**: sub-classification within the major category

0x6: CoreSight™ STM. The component generates trace based on software and hardware stimulus.

Bits 3:0 **MAJOR[3:0]**: major classification for debug or trace component

0x3: the component is a trace source

STM peripheral ID4 register (STM_PIDR4)

Address offset: 0xFD0

Reset value: 0x0000 0004

This register belongs to the set of peripheral identification registers. It contains part of the designer identity and the memory footprint indicator.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SIZE[3:0]				DES_2[3:0]			
								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **SIZE[3:0]**: component memory size indicator

Indicates the total contiguous size of the memory window used by the component in powers of two from the standard 4 Kbytes. If a component only requires the standard 4 Kbytes, this bit field must read as 0x0. For 8 Kbytes it is set to 0x1. For 16 Kbytes it set to 0x2. For 32 Kbytes it is set to 0x3, and similarly for larger memory windows.

0x0: the device only occupies 4 Kbytes of memory

Bits 3:0 **DES_2[3:0]**: JEDEC continuation code

Indicates the designer of the component, together with the identity code.

0x4: indicates that Arm® JEDEC identity code is on the 5th bank

STM peripheral ID0 register (STM_PIDR0)

Address offset: 0xFE0

Reset value: 0x0000 0063 (0x0000 00FF)

This register belongs to the set of peripheral identification registers. It contains part of the designer specific part number.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	PART_0[7:0]							
								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **PART_0[7:0]**: bits [7:0] of the component part number

This field is specified by the designer of the component.

0x63: CoreSight™ STM Part Number[7:0]. Eight least significant bits of the part number (0x963).

STM peripheral ID1 register (STM_PIDR1)

Address offset: 0xFE4

Reset value: 0x0000 00B9

This register belongs to the set of peripheral identification registers. It contains part of the designer specific part number and part of the designer identity.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DES_0[3:0]				PART_1[3:0]			
								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **DES_0[3:0]**: bits [3:0] of the JEDEC identity code

Indicates the designer of the component, together with the continuation code.

0xB: least significant four bits of the JEP106 identity code.

Bits 3:0 **PART_1[3:0]**: bits [11:8] of the component part number

Specified by the designer of the component.

0x9: CoreSight™ STM part number[11:8]. Most significant four bits of the part number (0x963).

STM peripheral ID2 register (STM_PIDR2)

Address offset: 0xFE8

Reset value: 0x0000 001B

This register belongs to the set of peripheral identification registers. It contains part of the designer identity and the product revision.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	REVISION[3:0]				JEDEC	DES_1[2:0]		
								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **REVISION[3:0]**: incremental component design version

An incremental value starting from 0x0 for the first design of this component. The value increases by one at both major and minor revisions and is used as a look-up to establish the exact major and minor revisions.

0x1: this device is at r0p1.

Bit 3 **JEDEC**: JEDEC assigned value usage

Indicates the use of a JEDEC assigned value. This bit is always set.

1: the designer ID is specified by JEDEC (refer to <http://www.jedec.org>)

Bits 2:0 **DES_1[2:0]**: bits [6:4] of the JEDEC identity code

Indicates the designer of the component, together with the continuation code.

0x3: most significant three bits of the JEP106 identity code

STM peripheral ID3 register (STM_PIDR3)

Address offset: 0xFEC

Reset value: 0x0000 0000

This register belongs to the set of peripheral identification registers. It contains the RevAnd and Customer_Modified bit fields.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	REVAND[3:0]				CMOD[3:0]			
								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **REVAND[3:0]**: minor fix indicator

Indicates minor errata fixes specific to the design, for example metal fixes after implementation. In most cases this field is 0x0. Arm® recommends that the component designers ensure that the bit field can be changed by a metal fix if required, for example by driving the bit field from registers that reset to zero.

0x0: no metal fix in the component

Bits 3:0 **CMOD[3:0]**: customer modification indicator

When the component is a reusable IP, this value indicates if the customer has modified the behavior of the component. In most cases this field is 0x0.

0x0: no modification made

STM component ID0 register (STM_CIDR0)

Address offset: 0xFF0

Reset value: 0x0000 000D

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CLASS[3:0]				PRMBL_1[3:0]			
								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **CLASS[3:0]**: component class

Indicates the class of the component, for example, ROM table or CoreSight™ component.
0x9: indicates that the component is a CoreSight™ component

Bits 3:0 **PRMBL_1[3:0]**: bits [19:16] of component identification.

Component identification register, that indicates that the identification registers are present.
0x0: identification value

STM component ID2 register (STM_CIDR2)

Address offset: 0xFF8

Reset value: 0x0000 0005

66.10.9 Microprocessor debug unit (DBGMCU)

The DBGMCU is a component containing a number of registers which control the power and clock behavior in debug mode. Specifically it allows the debugger, or debug software, to:

- maintain the clock and power to the processors when in low power modes (Sleep, Stop or Standby)
- maintain the clock and power to the system debug and trace components when in low power modes
- stop the clock to certain peripherals (CAN, SMBUS timeout, Watchdogs, Timers, RTC) when either processor is stopped in debug mode

Low power mode emulation in debug

When entering a low power mode (CSleep, Stop, LP-Stop, LPLV-Stop or Standby), the clock to the processor, the subsystem clocks or, in the case of Standby mode, the core power

supply may be switched off. This prevents any debug accesses to the unlocked domains. To simplify debugging of applications which use these power saving features, the clock and power can be maintained or not according to the setting of the DBGSTBY, DBGSTOP and DBGSLEEP bits in the DBGMCU_CR register. These bits can be accessed directly by the debugger or by debug software, meaning that the application software does not need to be modified.

If the system enters one of the power saving modes, and the corresponding register bit is set, the system enters and exits the low power state as normal. However the clock and power remain active, allowing the debugger full access.

Note: If the trace port interface (TPIU) is used, loss of trace data can occur if the system goes into Standby mode and switches off the core power before the TPIU FIFO is empty. The software can check the state of the FIFO to avoid this. However if the DBGSTBY bit is set while using the trace port, the trace continues to flush during Standby mode and no specific software action is required.

Peripheral clock “freeze” in debug

When one or more processors are halted in debug state, by default the peripherals continue to operate. This means that the system state at the moment the breakpoint was taken is overwritten and can not be recovered. Furthermore, certain peripherals require software intervention on a regular basis, without which they may time out and generate a reset (watchdogs, for example).

By setting the corresponding bits in the DBGMCU Peripheral Freeze registers, certain peripheral clocks can be stopped automatically as soon as one or both processors enter debug state. The clocks remain stopped until the processor is restarted.

The following peripherals support this feature:

- All timers (TIMn, LPTIMn)
- All I2C peripherals (to prevent SMBus timeout)
- FDCAN
- All watchdog timers (WWDG, IWDGn)
- Real time clock (RTC)

There is a pair of freeze registers for each peripheral bus (APB), to control the peripherals on that bus. One register of each pair controls whether the peripheral is sensitive to the Cortex[®]-A7 debug state, the other to the Cortex[®]-M4. It is recommended to use the register that corresponds to the processor responsible for rearming the peripheral timeout.

The Cortex[®]-M4 debug state corresponds to a high level on the M4 core **HALTED** signal (**HALTED** remains asserted while the core is in debug). That of the Cortex[®]-A7 is an OR of the **DBGACK** signal from each core (the core asserts **DBGACK** to indicate that the system has entered debug state). Hence if either CA7 core enters debug and the corresponding bit in the Peripheral Freeze register is set, then the peripheral clock will be frozen.

The IWDG1 (secure watchdog for the CA7) is an exception to the above. When secure debugging is disabled (**spiden** = 0), any CPU core which is in secure state will not stop in debug mode until it exits secure state. For security reasons, when **spiden** = 0, the IWDG1 timer will not stop unless **DBGACK** signal is active for both CPU cores, meaning both cores have stopped and hence both cores are in non-secure state. When secure debugging is enabled (**spiden** = 1), the behavior is determined by the WDFZCTL bit in the DBGMCU_CR register.

The IWDG1 behavior is summarized in truth [Table 598](#).

Table 598. IWDG1 behavior in debug

Inputs					IWDG1 frozen?
DBGMCU_APB5FZ1 .IWDG1	spiden	DBGMCU_CR .WDFZCTL	DEBUGACK (CA7-0)	DEBUGACK (CA7-1)	
0	X	X	X	X	N
1	0	X	0	X	N
1	0	X	X	0	N
1	0	X	1	1	Y
1	1	0	0	0	N
1	1	0	1	X	Y
1	1	0	X	1	Y
1	1	1	0	X	N
1	1	1	X	0	N
1	1	1	1	1	Y

Microprocessor debug unit registers

The DBGMCU registers are not reset by a system reset **nreset**, only by a power on reset **vcore_rst**, by the debugger using CDBGIRSTREQ/ACK, or by dbg_rstn which is set by writing to the bit DBG_RST of RCC Debug Configuration register (RCC_DBGCFGR). They are accessible to the debugger via the debug APB bus at base address 0xE0081000. They are also accessible by both processors at base address 0x50081000

Note: The DBGMCU is not a standard CoreSight™ component and so does not appear in the system ROM table.

DBGMCU identity code register (DBGMCU_IDC)

Address offset: 0x000

Reset value: 0xXXXX X500

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:0 **DEV_ID[11:0]**: device ID
0x500: STM32MP15xx

DBGMCU configuration register (DBGMCU_CR)

Address offset: 0x004

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	TRGOEN	Res.	Res.	Res.	WDFZCTL	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
			rw				rw								
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DBGSTBY	DBGSTOP	DBGSLEEP
													rw	rw	rw

Bits 31:29 Reserved, must be kept at reset value.

Bit 28 **TRGOEN**: external trigger output enable
 This bit controls the direction of the DBTRGIO bi-directional trigger pin.
 0: input. DBTRGIO is connected to DBTRGI
 1: output. DBTRGIO is connected to DBTRGO

Bits 27:25 Reserved, must be kept at reset value.

Bit 24 **WDFZCTL**: IWDG1 secure debug behavior
 This bit determines the behavior of the IWDG1 in debug mode when **spiden** = 1. Refer to [Table 598: IWDG1 behavior in debug](#) for details.
 0: OR. Freeze watchdog timer when either CA7 core halts in debug mode
 1: AND. Freeze watchdog timer only when both CA7 cores halt in debug mode

Bits 23:3 Reserved, must be kept at reset value.

Bit 2 **DBGSTBY**: Standby mode debug enable
 0: normal operation. All clocks are disabled and the V_{DDCORE} domain powered down automatically in Standby mode.
 1: automatic clock stop/power down disabled. All active clocks and oscillators continue to run during Standby mode, and the V_{DDCORE} domain supply is maintained, allowing full debug capability. On exit from Standby mode, a system reset is performed.

Bit 1 **DBGSTOP**: Stop mode debug enable
 0: normal operation. In Stop or CStop mode, clocks may be stopped.
 1: automatic clock stop disabled. All active clocks and oscillators continue to run during Stop, LP-Stop or CStop mode, allowing full debug capability. On exit from low-power mode, the clock settings are set to the normal low-power mode exit state.

Bit 0 **DBGSLEEP**: Sleep mode debug enable
 0: normal operation. Processor clock is stopped automatically in CSleep mode.
 1: automatic clock stop disabled. Processor clock continues to run, allowing full debug capability.

Note: this bit only affects the Cortex[®]-M4, the Cortex[®]-A7 debug clock continues to run even when the core clocks are stopped (PxSTOP mode).

DBGMCU APB4 peripheral freeze register MPU (DBGMCU_APB4FZ1)

Address offset: 0x02C

Reset value: 0x0000 0000

Bits 31:22 Reserved, must be kept at reset value.

Bit 21 **I2C5**: I2C5 SMBUS timeout stop in debug

0: normal operation. I2C5 SMBUS timeout continues to operate while Cortex®-A7 is in debug mode.

1: stop in debug. I2C5 SMBUS timeout is frozen while either Cortex®-A7 core is in debug mode.

Bit 20 **I2C3**: I2C3 SMBUS timeout stop in debug

0: normal operation. I2C3 SMBUS timeout continues to operate while Cortex®-A7 is in debug mode.

1: stop in debug. I2C3 SMBUS timeout is frozen while either Cortex®-A7 core is in debug mode.

Bit 19 **I2C2**: I2C2 SMBUS timeout stop in debug

0: normal operation. I2C2 SMBUS timeout continues to operate while Cortex®-A7 is in debug mode.

1: stop in debug. I2C2 SMBUS timeout is frozen while either Cortex®-A7 core is in debug mode.

Bit 18 **I2C1**: I2C1 SMBUS timeout stop in debug

0: normal operation. I2C1 SMBUS timeout continues to operate while Cortex®-A7 is in debug mode.

1: stop in debug. I2C1 SMBUS timeout is frozen while either Cortex®-A7 core is in debug mode.

Bits 17:11 Reserved, must be kept at reset value.

- Bit 10 **WWDG1**: WWDG1 stop in debug
0: normal operation. WWDG1 continues to operate while Cortex[®]-A7 is in debug mode.
1: stop in debug. WWDG1 is frozen while either Cortex[®]-A7 core is in debug mode.
- Bit 9 **LPTIM1**: LPTIM1 stop in debug
0: normal operation. LPTIM1 continues to operate while Cortex[®]-A7 is in debug mode.
1: stop in debug. LPTIM1 is frozen while either Cortex[®]-A7 core is in debug mode.
- Bit 8 **TIM14**: TIM14 stop in debug
0: normal operation. TIM14 continues to operate while Cortex[®]-A7 is in debug mode.
1: stop in debug. TIM14 is frozen while either Cortex[®]-A7 core is in debug mode.
- Bit 7 **TIM13**: TIM13 stop in debug
0: normal operation. TIM13 continues to operate while Cortex[®]-A7 is in debug mode.
1: stop in debug. TIM13 is frozen while either Cortex[®]-A7 core is in debug mode.
- Bit 6 **TIM12**: TIM12 stop in debug
0: normal operation. TIM12 continues to operate while Cortex[®]-A7 is in debug mode.
1: stop in debug. TIM12 is frozen while either Cortex[®]-A7 core is in debug mode.
- Bit 5 **TIM7**: TIM7 stop in debug
0: normal operation. TIM7 continues to operate while Cortex[®]-A7 is in debug mode.
1: stop in debug. TIM7 is frozen while either Cortex[®]-A7 core is in debug mode.
- Bit 4 **TIM6**: TIM6 stop in debug
0: normal operation. TIM6 continues to operate while Cortex[®]-A7 is in debug mode.
1: stop in debug. TIM6 is frozen while either Cortex[®]-A7 core is in debug mode.
- Bit 3 **TIM5**: TIM5 stop in debug
0: normal operation. TIM5 continues to operate while Cortex[®]-A7 is in debug mode.
1: stop in debug. TIM5 is frozen while either Cortex[®]-A7 core is in debug mode.
- Bit 2 **TIM4**: TIM4 stop in debug
0: normal operation. TIM4 continues to operate while Cortex[®]-A7 is in debug mode.
1: stop in debug. TIM4 is frozen while either Cortex[®]-A7 core is in debug mode.
- Bit 1 **TIM3**: TIM3 stop in debug
0: normal operation. TIM3 continues to operate while Cortex[®]-A7 is in debug mode.
1: stop in debug. TIM3 is frozen while either Cortex[®]-A7 core is in debug mode.
- Bit 0 **TIM2**: TIM2 stop in debug
0: Normal operation. TIM2 continues to operate while Cortex[®]-A7 is in debug mode.
1: Stop in debug. TIM2 is frozen while either Cortex[®]-A7 core is in debug mode.

DBGMCU APB1 peripheral freeze register MCU (DBGMCU_APB1FZ2)

Address offset: 0x038

Reset value: 0x0000 0000

Bit 18 **I2C1**: I2C1 SMBUS timeout stop in debug

- 0: normal operation. I2C1 SMBUS timeout continues to operate while Cortex[®]-M4 is in debug mode.
- 1: stop in debug. I2C1 SMBUS timeout is frozen while Cortex[®]-M4 is in debug mode.

Bits 17:11 Reserved, must be kept at reset value.

Bit 10 **WWDG1**: WWDG1 stop in debug

- 0: normal operation. WWDG1 continues to operate while Cortex[®]-M4 is in debug mode.
- 1: stop in debug. WWDG1 is frozen while Cortex[®]-M4 is in debug mode.

Bit 9 **LPTIM1**: LPTIM1 stop in debug

- 0: normal operation. LPTIM1 continues to operate while Cortex[®]-M4 is in debug mode.
- 1: stop in debug. LPTIM1 is frozen while Cortex[®]-M4 is in debug mode.

Bit 8 **TIM14**: TIM14 stop in debug

- 0: normal operation. TIM14 continues to operate while Cortex[®]-M4 is in debug mode.
- 1: stop in debug. TIM14 is frozen while Cortex[®]-M4 is in debug mode.

Bit 7 **TIM13**: TIM13 stop in debug

- 0: normal operation. TIM13 continues to operate while Cortex[®]-M4 is in debug mode.
- 1: stop in debug. TIM13 is frozen while Cortex[®]-M4 is in debug mode.

Bit 6 **TIM12**: TIM12 stop in debug

- 0: normal operation. TIM12 continues to operate while Cortex[®]-M4 is in debug mode.
- 1: stop in debug. TIM12 is frozen while Cortex[®]-M4 is in debug mode.

Bit 5 **TIM7**: TIM7 stop in debug

- 0: normal operation. TIM7 continues to operate while Cortex[®]-M4 is in debug mode.
- 1: stop in debug. TIM7 is frozen while Cortex[®]-M4 is in debug mode.

Bit 4 **TIM6**: TIM6 stop in debug

- 0: normal operation. TIM6 continues to operate while Cortex[®]-M4 is in debug mode.
- 1: stop in debug. TIM6 is frozen while Cortex[®]-M4 is in debug mode.

- Bit 3 **TIM5**: TIM5 stop in debug
 - 0: normal operation. TIM5 continues to operate while Cortex[®]-M4 is in debug mode.
 - 1: stop in debug. TIM5 is frozen while Cortex[®]-M4 is in debug mode.
- Bit 2 **TIM4**: TIM4 stop in debug
 - 0: normal operation. TIM4 continues to operate while Cortex[®]-M4 is in debug mode.
 - 1: stop in debug. TIM4 is frozen while Cortex[®]-M4 is in debug mode.
- Bit 1 **TIM3**: TIM3 stop in debug
 - 0: normal operation. TIM3 continues to operate while Cortex[®]-M4 is in debug mode.
 - 1: stop in debug. TIM3 is frozen while Cortex[®]-M4 is in debug mode.
- Bit 0 **TIM2**: TIM2 stop in debug
 - 0: normal operation. TIM2 continues to operate while Cortex[®]-M4 is in debug mode.
 - 1: stop in debug. TIM2 is frozen while Cortex[®]-M4 is in debug mode.

DBGMCU APB2 peripheral freeze register MPU (DBGMCU_APB2FZ1)

Address offset: 0x03C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rw							rw	rw	rw					rw	rw

Bits 31:16 Reserved, must be kept at reset value.

- Bit 15 **FDCAN**: FDCAN stop in debug
 - 0: normal operation. FDCAN continues to operate while Cortex[®]-A7 is in debug mode.
 - 1: stop in debug. FDCAN is frozen while either Cortex[®]-A7 core is in debug mode.

Bits 14:9 Reserved, must be kept at reset value.

- Bit 8 **TIM17**: TIM17 stop in debug
 - 0: normal operation. TIM17 continues to operate while Cortex[®]-A7 is in debug mode.
 - 1: stop in debug. TIM17 is frozen while either Cortex[®]-A7 core is in debug mode.
- Bit 7 **TIM16**: TIM16 stop in debug
 - 0: normal operation. TIM16 continues to operate while Cortex[®]-A7 is in debug mode.
 - 1: stop in debug. TIM16 is frozen while either Cortex[®]-A7 core is in debug mode.
- Bit 6 **TIM15**: TIM15 stop in debug
 - 0: normal operation. TIM15 continues to operate while Cortex[®]-A7 is in debug mode.
 - 1: stop in debug. TIM15 is frozen while either Cortex[®]-A7 core is in debug mode.

Bits 5:2 Reserved, must be kept at reset value.

Bit 1 **TIM8**: TIM8 stop in debug

- 0: normal operation. TIM8 continues to operate while Cortex[®]-A7 is in debug mode.
- 1: stop in debug. TIM8 is frozen while either Cortex[®]-A7 core is in debug mode.

Bit 0 **TIM1**: TIM1 stop in debug

- 0: normal operation. TIM1 continues to operate while Cortex[®]-A7 is in debug mode.
- 1: stop in debug. TIM1 is frozen while either Cortex[®]-A7 core is in debug mode.

DBGMCU APB2 peripheral freeze register MCU (DBGMCU_APB2FZ2)

Address offset: 0x040

Reset value: 0x0000 0000

66.11 Cortex[®]-A7 debug features

The Cortex[®]-A7 subsystem integrates the following CoreSight[™] components, one of each per core:

- Debug unit (DBG)
- Performance Monitoring Unit (PMU)
- Embedded Trace Macrocell (ETM)
- Cross Trigger Interface (CTI)

These components are accessible by the debugger via the APB-AP and its associated debug APB bus. They are also accessible by both Cortex[®]-A7 and Cortex[®]-M4 via the system interconnect.

66.11.1 Cortex[®]-A7 debug unit

The debug unit enables the debugger to access the debug features built into the Cortex[®]-A7 MPCore. The debug features allow an external debugger to:

- Stop program execution
- Examine and alter process and coprocessor state
- Examine and alter memory and input/output peripheral state
- Restart the processor

For detailed information on the debug unit, refer to the *Cortex[®]-A7 MPCore Technical Reference Manual [9]*.

Debug unit registers

The debug unit comprises a number of registers accessible to the debugger via the debug APB at address range 0xE00D 0000 to 0xE00D 0FFC for CA7-CPU1, and 0xE00D 2000 to 0xE00D 2FFC for CA7-CPU2. The same registers are accessible to software at address range 0x500D 0000 to 0x500D 0FFC for CA7-CPU1, and 0x500D 2000 to 0x500D 2FFC for CA7-CPU2.

Each Cortex[®]-A7 core can access certain of its own debug unit registers via the CP14 (baseline and extended) registers, using MCR, MRC, MCCR and MRRC instructions.

DBG identification register (DBG_DIDR)

Address offset: 0x000

Reset value: 0x3515 F005

Specifies which version of debug architecture is implemented and what features.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

r	r	r	r					r	r	r	r	r	r	r	r

Bits 31:28 **WRPS[3:0]**: Watchpoint Registers Pairs.

Indicates the number of watchpoint register pairs implemented.
0x3: The processor implements 4 WRPs

Bits 27:24 **BRPS[3:0]**: Breakpoint Registers Pairs.

Indicates the number of breakpoint register pairs implemented.
0x5: The processor implements 6 BRPs

Bits 23:20 **CTX_CMPS[3:0]**: Context ID comparators.

Indicates the number of BRPs that can be used for Context ID comparison.
0x1: The processor implements 2 breakpoints with context ID comparison

Bits 19:16 **VERSION[3:0]**: Debug Architecture version.

0x5: Arm[®]v7.1 debug architecture

- Bit 15 **DEVIDIMP**: Debug Device ID register (DBGDEVID) implemented.
1: Implemented
- Bit 14 **NSUHDIMP**: Secure User Halting Debug implemented.
1: Not implemented
- Bit 13 **PCSRIMP**: Program Counter Sampling Register (DBGPCSR) implemented as register 33.
1: Implemented
- Bit 12 **SEIMP**: Security Extensions implemented.
1: Implemented
- Bits 11:8 Reserved, must be kept at reset value.
- Bits 7:4 **VARIANT[3:0]**: Processor Variant number.
This number is incremented on functional changes. This field matches bits [23:20] of the CP15 Main ID register.
0x0: Variant = 0
- Bits 3:0 **REVISION[3:0]**: Processor Revision number.
This number is incremented on bug fixes. This field matches bits [3:0] of the CP15 Main ID register.
0x5: Revision = 5

DBG watchpoint fault address register (DBG_WFAR)

Address offset: 0x018

Reset value: 0x0000 0000

Returns information about the address of the instruction that accessed a watchpointed address. Not used in this version of debug architecture.

- Bits 31:0 **ADDRESS[31:0]**: Instruction address.
This register is unused.

DBG vector catch register (DBG_VCR)

Address offset: 0x01C

Reset value: 0x0000 0000

Controls Vector catch debug events.

DBG event catch register (DBG_ECR)

Address offset: 0x024

Reset value: 0x0000 0000

Configures the debug logic to generate the OS Unlock catch debug event when the OS Lock is cleared.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

															rw

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **OSUCE**: OS Unlock Catch enable.

An OS Unlock catch debug event is generated when the OS Lock is cleared by writing to the DBGOSLAR.

- 0: Disabled
- 1: Enabled

DBG host to target data transfer register (DBG_DTRRX)

Address offset: 0x080

Reset value: 0x0000 0000

Transfers data from an external host to the Arm® processor. For example it is used by a debugger transferring commands and data to a debug target. It is a component of the Debug Communication Channel (DCC).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
DATA[31:16]

DATA[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **DATA[31:0]**: Host to Target Data.

One word of data for transfer from the debug host to the debug target.

DBG instruction transfer register (DBG_ITR)

Address offset: 0x084

Reset value: 0x0000 0000

When the processor is in Debug state, transfers an Arm® instruction to the processor for execution.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
INSTRUCTION[31:16]

INSTRUCTION[15:0]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w

Bits 31:0 **INSTRUCTION[31:0]**: Instruction.

32-bit encoded Arm® instruction to execute on the processor

DBG status and control register (DBG_DSCR)

Address offset: 0x088

Reset value: 0x0000 0000

The main control register for debug.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	RXFUL L	TXFUL L	Res.	RXFUL L_L	TXFUL L_L	PIPEA DV	INSTR COMP L_L	Res.	Res.	EXTDCCMODE[1:0]		ADADI SCARD	NS	SPNID DIS	SPIDDI S

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 Reserved, must be kept at reset value.

Bit 30 **RXFULL**: DBGDTRRX register full.

0: Register empty

1: Register full

Bit 29 **TXFULL**: DBGDTRTX register full.

0: Register empty

1: Register full

Bit 28 Reserved, must be kept at reset value.

- Bit 27 **RXFULL_L**: Latched RXfull.
This controls the behavior of the processor on writes to DBGDTRRX in non-blocking mode (DBGDSCR.EXTDCCMODE = 0x0)
0: Writes to DBGDTRRX execute and set the RXFULL and RXFULL_L bits to 1
1: Writes to DBGDTRRX are ignored
- Bit 26 **TXFULL_L**: Latched TXfull.
This controls the behavior of the processor on reads to DBGDTRTX in non-blocking mode (DBGDSCR.EXTDCCMODE = 0x0)
0: Reads to DBGDTRTX return an undefined value
1: Reads to DBGDTRTX return the register contents and reset the TXFULL and TXFULL_L bits to 0
- Bit 25 **PIPEADV**: Sticky Pipeline Advance (Read only).
This bit is set to 1 whenever the processor pipeline advances by retiring one or more instructions. It is cleared to 0 only by a write to DBGDRCR.CSPA. This bit enables a debugger to detect that the processor is idle. In some situations this might indicate that the processor is deadlocked.
- Bit 24 **INSTRCOMPL_L**: Latched Instruction Complete (Read Only).
This is a copy of the internal InstrCompl flag, taken on each read of DBGDSCR InstrCompl signals whether the processor has completed execution of an instruction issued through DBGITR. InstrCompl is not visible directly in any register. On a read of DBGDSCR when the processor is in Debug state, InstrCompl_I always returns the current value of InstrCompl. The meanings of the values of InstrCompl_I are:
0: An instruction previously issued through the DBGITR has not completed its changes to the architectural state of the processor.
1: All instructions previously issued through the DBGITR have completed their changes to the architectural state of the processor.
- Bits 23:22 Reserved, must be kept at reset value.
- Bits 21:20 **EXTDCCMODE[1:0]**: External DCC Access Mode.
This field controls the access mode for the DCC registers and the DBG_ITR.
0x0: Non-blocking mode. Accesses always complete without stalling the bus.
0x1: Stall mode. Accesses stall the bus until they can complete successfully.
0x2: Fast mode. Allows an instruction to be latched in the DBG_ITR and executed repeatedly by successive read accesses to DBG_DTRTX, or write accesses to DBG_DTRRX
0x3: Reserved
- Bit 19 **ADADISCARD**: Asynchronous Aborts Discarded.
0: Asynchronous aborts handled normally
1: On an asynchronous abort to which this bit applies, the processor sets the Sticky Asynchronous Abort bit, ADABORT_L, to 1 but otherwise discards the abort.
- Bit 18 **NS**: Non-Secure state status (Read Only).
0: Processor is in Secure state
1: Processor is in Non-Secure state
- Bit 17 **SPNIDDIS**: Secure PL1 Non-Invasive Debug Disabled (Read Only).
This bit shows if non-invasive debug is permitted in Secure PL1 modes.
0: Non-invasive debug permitted in Secure PL1 modes
1: Non-invasive debug not permitted in Secure PL1 modes

- Bit 16 **SPIDDIS**: Secure PL1 Invasive Debug Disabled (Read Only).
This bit shows if invasive debug is permitted in Secure PL1 modes.
0: Invasive debug permitted in Secure PL1 modes
1: Invasive debug not permitted in Secure PL1 modes
- Bit 15 **MDBGEN**: Monitor Debug mode enable.
0: Monitor debug mode disabled
1: Monitor debug mode enabled
- Bit 14 **HDBGEN**: Halting Debug mode enable.
0: Halting debug mode disabled
1: Halting debug mode enabled
- Bit 13 **ITREN**: Enable Arm[®] instruction execution.
This bit enables the execution of Arm[®] instructions through the DBGITR. This bit should always be written low when the processor is not in debug state.
0: ITR mechanism disabled
1: ITR mechanism enabled
- Bit 12 **UDCCDIS**: User mode access to Debug Communications Channel (DCC) disable.
0: DCC access in User mode enabled
1: User mode access to any DCC register via CP14 will generate an undefined instruction exception
- Bit 11 **INTDIS**: Interrupt disable.
0: FIQ and IRQ enabled
1: FIQ and IRQ masked
- Bit 10 **DBGACK**: Force Debug Acknowledge.
This allows the debugger to simulate debug mode entry via the cross-trigger while the core remains in non-debug mode.
0: Normal operation
1: DBGACK asserted
- Bit 9 **FS**: Fault Status (Read Only).
This bit is updated when a data abort exception is generated in debug state. It indicates where the fault information is held.
0: Fault status information may be held in PL1 fault reporting registers (DFSR and DFAR) or PL2 fault syndrome registers (HSR, HDFAR) according to current state, mode and the HCR.TGE register value
1: Fault status information was written to the PL2 fault syndrome registers
- Bit 8 **UND_L**: Sticky Undefined Instruction (Read Only).
This bit is set to 1 by any Undefined Instruction exceptions generated by instructions issued to the processor while in Debug state.
0: No Undefined Instruction exception has been generated since the last time this bit was cleared
1: An Undefined Instruction exception has been generated since the last time this bit was cleared
- Bit 7 **ADABORT_L**: Sticky Asynchronous Abort (Read Only).
This bit is set to 1 by any asynchronous abort that occurs while in Debug state, if ADADISCARD bit is set to 1.
0: No Asynchronous Abort has been generated since the last time this bit was cleared
1: An Asynchronous Abort has been generated since the last time this bit was cleared

Bit 6 **SDABORT_L**: Sticky Synchronous Data Abort (Read Only).

This bit is set to 1 by any synchronous data abort exception generated while in Debug state.
 0: No synchronous Data Abort has been generated since the last time this bit was cleared
 1: A synchronous Data Abort has been generated since the last time this bit was cleared

Bits 5:2 **MOE[3:0]**: Method of Debug Entry (Read Only).

Indicates the debug event which caused the processor to enter into debug mode.
 0x0: Halt request
 0x1: Breakpoint
 0x2: Asynchronous watchpoint
 0x3: BKPT instruction
 0x4: External debug request
 0x5: Vector catch
 0x6 to 0x7: Reserved
 0x8: OS unlock catch
 0x9: Reserved
 0xA: Synchronous watchpoint
 0xB to 0xF: Reserved

Bit 1 **RESTARTED**: Processor Restarted (Read Only).

After making a restart request, the debugger can poll this bit until it is set to 1. At that point it knows that the restart request has taken effect and the processor has exited Debug state.
 0: The processor is exiting Debug state. This bit only reads as 0 between receiving a restart request, and restarting Non-debug state operation
 1: The processor has exited Debug state. This bit remains set to 1 if the processor re-enters Debug state.

Bit 0 **HALTED**: Processor Halted (Read Only).

After programming a debug event, the external debugger can poll this bit until it is set to 1. At that point it knows that the processor has entered Debug state.
 0: The processor is in Non-debug state
 1: The processor is in Debug state

DBG target to host data transfer register (DBG_DTRTX)

Address offset: 0x08C

Reset value: 0x0000 0000

Transfers data from the Arm® processor to an external host. For example it is used by a debug target to transfer commands and data to a debugger. It is a component of the Debug Communication Channel (DCC).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
DATA[31:16]

DATA[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **DATA[31:0]**: Target to Host Data.

One word of data for transfer from the debug target to the debug host.

DBG run control register (DBG_DRCR)

Address offset: 0x090

Reset value: 0x0000 0000

Software uses this register to request the processor to enter or exit Debug state, and to clear the sticky exception bits in the DBG_DSCR.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CBRR Q	CSPA	CSE	RRQ	HRQ
											rw	rw	rw	rw	rw

Bits 31:5 Reserved, must be kept at reset value.

Bit 4 **CBRRQ**: Cancel Bus Requests.

- 0: No action
- 1: Request cancel of pending accesses

Bit 3 **CSPA**: Clear Sticky Pipeline Advance bit.

- 0: No action
- 1: Reset the DBG_DSCR.PIPEADV bit to 0

Bit 2 **CSE**: Clear Sticky Exception bits..

- 0: No action
- 1: Resets the DBG_DSCR[8:6] bits to 0

Bit 1 **RRQ**: Restart Request.

This request is held until the processor exits Debug state. After the request has been made, the debugger can poll the DBG_DSCR.RESTARTED bit until it reads as 1.

- 0: No action
- 1: Request exit from debug mode.

Bit 0 **HRQ**: Halt Request.

This request is held until the processor enters Debug state. After the request has been made, the debugger can poll the DBG_DSCR.HALTED bit until it reads as 1.

- 0: No action
- 1: Request entry from debug mode.

DBG external auxiliary control register (DBG_EACR)

Address offset: 0x094

Reset value: 0x0000 0000

Provides implementation-defined configuration and control options.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CDRSTAT	Res.	Res.	Res.
												r			

Bits 31:4 Reserved, must be kept at reset value.

Bit 3 **CDRSTAT**: Core Debug Reset Status (Read Only).

Reflects the current reset state of the debug logic in the CPU power domain.

0: Debug logic in CPU power domain is not in reset state

1: Debug logic in CPU power domain is in reset state

Bits 2:0 Reserved, must be kept at reset value.

DBG program counter sampling register (DBG_PCSR)

Address offset: 0x0A0

Reset value: 0x0000 0000

This register provides implementation-defined configuration and control options.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
PCS[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

PCS[15:1]															T
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:1 **PCS[31:1]**: Program Counter Sample value.

The sampled value of bits[31:1] of the PC. The sampled value is either the virtual address of an instruction, or the virtual address of an instruction address plus an offset that depends on the processor instruction set state. DBG_DEVID1.PCSROFFSET indicates whether an offset is applied to the sampled addresses.

Bit 0 **T**: Thumb instruction.

This bit indicates whether the sampled address is an Arm® instruction, or a Thumb or ThumbEE instruction:

0: Arm® instruction

1: Thumb or ThumbEE instruction

DBG context ID sampling register (DBG_CIDSR)

Address offset: 0x0A4

Reset value: 0x0000 0000

Samples the CONTEXTIDR whenever the DBG_PCSR samples the program counter. This enables a debugger to associate a program counter sample with the process running on the processor.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
CONTEXTIDR[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

CONTEXTIDR[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **CONTEXTIDR[31:0]**: Context ID Register sample value.
 The value of the Context ID Register, CONTEXTIDR, associated with the last PC sample read from DBG_PCSR.

DBG virtualisation id sampling register (DBG_VIDSR)

Address offset: 0x0A8

Reset value: 0x0000 0000

Samples the VMID, Hyp mode status, and NS state whenever the DBGPCSR samples the program counter. This enables a debugger to associate a program counter sample with the virtual machine running on the processor.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	VMID[7:0]							
								rW	rW	rW	rW	rW	rW	rW	rW

Bit 31 **NS**: Sampled NS state.
 Indicates the Secure or Non-secure state associated with the last PC sample read from DBGPCSR.
 0: Secure state
 1: Non-secure state

Bit 30 **H**: Sampled Hyp mode. Indicates whether the last PC sample read from DBG_PCSR was associated with Hyp mode.
 0: Not Hyp mode
 1: Hyp mode

Bits 29:8 Reserved, must be kept at reset value.

Bits 7:0 **VMID[7:0]**: VMID sample.
 The value of the VMID field from the VTTBR, associated with the last PC sample read from DBG_PCSR.

DBG breakpoint value x register (DBG_BVRx)

Address offset: 0x100 + 0x4 * x, (x = 0 to 5)

Reset value: 0x0000 0000

Holds a value for use in breakpoint matching, either an instruction address or a Context ID. Each DBG_BVR is associated with a DBG_BCR to form a Breakpoint Register Pair (BRP) ie. DBG_BVR[n] is associated with DBG_BCR[n] to form breakpoint n.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
ADDRESSCONTEXTID[31:16]															
r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ADDRESSCONTEXTID[15:0]															
r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w

Bits 31:0 **ADDRESSCONTEXTID[31:0]**: Instruction Address or Context ID.

If the register is being used for address comparison, this field contains the instruction address to be matched (bits 31:2; bits 1:0 must be set to zero). If the register is being used for context ID comparison, this field contains the Context ID to be matched.

DBG breakpoint control x register (DBG_BCRx)

Address offset: 0x140 + 0x4 * x, (x = 0 to 5)

Reset value: 0x0000 0000

Holds control information for breakpointing. Each DBG_BCR is associated with a DBG_BVR to form a Breakpoint Register Pair (BRP) ie. DBG_BCR[n] is associated with DBG_BVR[n] to form breakpoint n.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	BT[3:0]				LBN[3:0]			
								r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SSC[1:0]		HMC	Res.	Res.	Res.	Res.	BAS[3:0]				Res.	Res.	PMC[1:0]		E
r/w	r/w	r/w					r/w	r/w	r/w	r/w			r/w	r/w	r/w

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:20 **BT[3:0]**: Breakpoint Type.

Determines the type of comparison made by the breakpoint.

- 0x0: Unlinked instruction address match
- 0x1: Linked instruction address match
- 0x2: Unlinked Context ID match
- 0x3: Linked Context ID match
- 0x4: Unlinked instruction address mismatch
- 0x5: Linked instruction address mismatch
- 0x6-0x7: Reserved
- 0x8: Unlinked VMID match
- 0x9: Linked VMID match
- 0xA: Unlinked VMID match and Context ID match
- 0xB: Linked VMID match and Context ID match
- 0xC-0xF: Reserved

Bits 19:16 **LBN[3:0]**: Linked Breakpoint Number.

If this breakpoint is programmed for Linked instruction address match or mismatch then this field must be programmed with the number of the breakpoint that holds the Context match to be used in the combined instruction address and Context comparison. Otherwise, this field must be programmed to 0.

Bits 15:14 **SSC[1:0]**: Security State Control.

This field enables the breakpoint to be conditional on the security state of the processor. This field must be programmed to 0 if DBG_BCR.BT is programmed for Linked Context ID match.

- 0: Secure and Non-secure state
- 1: Non-secure state only
- 2: Secure state only
- 3: Hyp mode only (with HMC=1 and PMC = 0)

Bit 13 **HMC**: Hyp Mode Control.

This field controls whether the breakpoint matches in Hyp mode. This field must be programmed to 0 if DBG_BCR.BT is programmed for Linked Context ID match.

- 0: Breakpoint does not match in Hyp mode
- 1: Breakpoint can match in Hyp mode

Bits 12:9 Reserved, must be kept at reset value.

Bits 8:5 **BAS[3:0]**: Byte Address Select.

This field enables match or mismatch comparisons on only certain bytes of the word address held in the DBG_BVR. The operation of this field depends also on:

- The breakpoint type field being programmed for instruction address match or mismatch.
 - The instruction set state of the processor, indicated by the CPSR.J and CPSR.T bits.
- This field must be programmed to 0xF if the DBG_BVR.BT is programmed for Linked or Unlinked Context ID match.

Bits 4:3 Reserved, must be kept at reset value.

Bits 2:1 **PMC[1:0]**: Privileged Mode Control.

This field enables the breakpoint to be conditional on the mode of the processor. This field must be programmed to 3 if DBG_BCR.BT is programmed for Linked Context ID match.

- 0: PL0, Supervisor and System modes only
- 1: PL1 and PL2 modes only
- 2: PL0 mode only
- 3: All modes

Bit 0 **E**: Breakpoint Enable.

- 0: Breakpoint disabled
- 1: Breakpoint enabled

DBG watchpoint value x register (DBG_WVRx)

Address offset: 0x180 + 0x4 * x, (x = 0 to 3)

Reset value: 0x0000 0000

Holds a value for use in Watchpoint matching, The address used must be the virtual address of the data. Each DBG_WVR is associated with a DBG_WCR to form a Breakpoint Register Pair (BRP) ie. DBG_WVR[n] is associated with DBG_WCR[n] to form breakpoint n.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
ADDRESS[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

ADDRESS[15:2]														Res.	Res.
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:2 **ADDRESS[31:2]**: Data Address.

This field indicates bits[31:2] of the address value for comparison.

Bits 1:0 Reserved, must be kept at reset value.

DBG watchpoint control xregister (DBG_WCRx)

Address offset: 0x1C0 + 0x4 * x (x=0 to 3)

Reset value: 0x0000 0000

Holds control information for watchpoint. Each DBG_WCR is associated with a DBG_WVR to form a Breakpoint Register Pair (BRP) ie. DBG_WCR[n] is associated with DBG_WVR[n] to form breakpoint n.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	
Res.	Res.	Res.	MASK[4:0]					Res.	Res.	Res.	WT	LBN[3:0]				
			rw	rw	rw	rw	rw				rw	rw	rw	rw	rw	
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
SSC[1:0]		HMC	BAS[7:0]							LSC[1:0]		PAC[1:0]		E		
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	

Bits 31:29 Reserved, must be kept at reset value.

Bits 28:24 **MASK[4:0]**: Address Mask.

This field can be used to set a watchpoint on a range of addresses by masking lower order address bits out of the watchpoint comparison. The value of this field is the number of low order bits of the address that are masked off, except that values of 1 and 2 are reserved.

- 0x0: No mask
- 0x1: Reserved
- 0x2: Reserved
- 0x3: Three bits masked (data address mask = 0x00000007)
- 0x4: Four bits masked (data address mask = 0x0000000F)
- 0x5: Five bits masked (data address mask = 0x0000001F)
- ..
- 0x1F: 31 bits masked (data address mask = 0x7FFFFFFF)

Bits 23:21 Reserved, must be kept at reset value.

Bit 20 **WT**: Watchpoint Type.

This bit is set to 1 to link the watchpoint to a breakpoint to create a linked watchpoint that requires both data address matching and Context ID matching. The linked breakpoint number field indicates the breakpoint to which this watchpoint is linked.

- 0: Linking disabled.
- 1: Linking enabled.

Bits 19:16 **LBN[3:0]**: Linked Breakpoint Number.

If this watchpoint is programmed with watchpoint type set to linking enabled, then this field must be programmed with the number of the breakpoint that defines the Context match to be combined with data address comparison. Otherwise, this field must be programmed to 0.

Bits 15:14 **SSC[1:0]**: Security State Control.

This field enables the watchpoint to be conditional on the security state of the processor.

- 0: Secure and Non-secure state
- 1: Non-secure state only
- 2: Secure state only
- 3: Hyp mode only (with HMC=1 and PAC = 0)

Bit 13 **HMC**: Hyp Mode Control.

This field controls whether the watchpoint matches in Hyp mode.

- 0: Watchpoint does not match in Hyp mode
- 1: Watchpoint can match in Hyp mode

Bits 12:5 **BAS[7:0]**: Byte Address Select.

A DBG_WVR is programmed with a word-aligned address. This field enables the watchpoint to hit only if certain bytes of the addressed word are accessed. The watchpoint hits if an access hits any byte being watched, even if:

The access size is larger than the size of the region being watched.

The access is unaligned, and the base address of the access is not in the same word of memory as the address in the DBG_WVR.

Watched bytes should be contiguous within a word ie. 11100001 should not be programmed.

Example values for BAS:

- 00000001: Watch byte 0
- 00000011: Watch bytes 1 and 0
- 00000010: Watch byte 1
- 00000111: Watch bytes 2, 1 and 0
- 11110000: Watch bytes 7,6,5 and 4
- etc.

Bits 4:3 **LSC[1:0]**: Load/store access control.

This field enables watchpoint matching conditional on the type of access being made.

- 0: Reserved
- 1: Match on any Load, Load-Exclusive or Swap
- 2: Match on any Store, Store-Exclusive, or Swap
- 3: Match on either type of access

Bits 2:1 **PAC[1:0]**: Privileged Access Control.

This field enables watchpoint matching conditional on the mode of the processor.

- 0: PL0, Supervisor and System modes only
- 1: PL1 and PL2 modes only
- 2: PL0 mode only
- 3: All modes

Bit 0 **E**: Watchpoint Enable.

- 0: Watchpoint disabled
- 1: Watchpoint enabled

DBG breakpoint extended value x register (DBG_BXVRx)

Address offset: $0x250 + 0x4 * x$, ($x = 0$ to 1)

Reset value: 0x0000 0000

Holds a value for use in VMID matching for BRP that supports Context ID comparison. Each DBG_BXVR is associated with a DBG_BCR/DBG_BVR Breakpoint Register Pair (BRP) ie. DBG_BXVR[n] is associated with DBG_BCR[n] and DBG_BVR[n] to form breakpoint n.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	VMID[7:0]									
								rw	rw	rw	rw	rw	rw	rw	rw		

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **VMID[7:0]**: Virtual Machine ID.

Used to compare with the Virtual Machine ID (VMID) field, held in the Virtualization Translation Table Base Register (VTTBR).

DBG OS lock access register (DBG_OSLAR)

Address offset: 0x300

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
OSLOCKACCESS[31:16]

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	OSLM [1]	NTT	OSLK	OSLM [0]
												r	r	r	r

Bits 31:4 Reserved, must be kept at reset value.

Bit 2 **NTT**: Need 32-bit.

0: 32-bit access is needed to write the key to the OS Lock Access Register.

Bit 1 **OSLK**: OS lock status

0: LOCK not set.

1: LOCK set. Access to DBG registers disabled

Bits 3, 0 **OSLM[1:0]**: OS lock model

This field identifies the form of OS Save and Restore mechanism implemented:

10: The processor implements the OS Lock Model but does not implement DBGOSRR

Others: Reserved

DBG device power-down and reset control register (DBG_PRCR)

Address offset: 0x310

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CORE PURQ	HCWR	CWRR	CORE NPDR Q
												rw	rw	rw	rw

Bits 31:4 Reserved, must be kept at reset value.

Bit 3 **COREPURQ**: Power-up request

This bit enables a debugger to request that the power controller powers up the processor, enabling access to debug registers in the processor power domain:

0: DBGPWRUPREQ is low

1: DBGPWRUPREQ is high

Bit 2 **HCWR**: Hold reset

0: Do not hold the non-debug logic reset on power-up or warm reset.

1: Hold the non-debug logic of the processor in reset on power-up or warm reset. The processor is held in this state until this bit is set to 0

Bit 1 **CWRR**: Reset request

0: No action

1: Request internal reset using the memory mapped interface or CP14

Bit 0 **CORENPDRQ**: Hold power-up request

0: DBGNOPWRDWN is low

1: DBGNOPWRDWN is high

DBG device power-down and reset status register (DBG_PRSR)

Address offset: 0x314

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DLK	OSLK	HALTE D	SR	R	SPD	PU
									r	r	r	r	r	r	r

Bits 31:7 Reserved, must be kept at reset value.

Bit 6 **DLK**: OS double lock status

- 0: OS double lock not set
- 1: OS double lock set

Bit 5 **OSLK**: OS lock status

- 0: OS lock not set
- 1: OS lock set

Bit 4 **HALTED**: Halted state

- 0: Processor is in non-debug state
- 1: Processor is in debug state

Bit 3 **SR**: Sticky reset

- 0: The non-debug logic of the processor has not been reset since the last time this register was read.
- 1: The non-debug logic of the processor has been reset since the last time this register was read.

Bit 2 **R**: Reset

- 0: The non-debug logic is not currently held in reset
- 1: The non-debug logic is currently held in reset

Bit 1 **SPD**: Sticky power-down status

- 0: The core power domain has not powered down since the last time this register was read
- 1: The core power domain has powered down since the last time this register was read

Bit 0 **PU**: Power-up status

- 0: The core power domain is powered down
- 1: The core power domain is powered up

DBG processor main ID register (DBG_MIDR)

Address offset: 0xD00

Reset value: 0x410F C075

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

r	r											r	r	r	r

Bits 31:29 **FORMAT[2:0]**: CTR format
 0x4: Arm[®]v7 format

Bit 28 Reserved, must be kept at reset value.

Bits 27:24 **CWG[3:0]**: Cache write-back granule
 Number of words of the maximum size of memory that can be overwritten as a result of the eviction of a cache entry that has had a memory location in it modified.
 0x4: 16 words

Bits 23:20 **ERG[3:0]**: Exclusives reservation granule.
 Number of words of the maximum size of the reservation granule that has been implemented for the Load-Exclusive and Store-Exclusive instructions.
 0x4: 16 words

Bits 19:16 **DMINLINE[3:0]**: Minimum data cache line.
 Number of words in the smallest cache line of all the data and unified caches that the processor controls.
 0x4: 16 words

Bits 15:14 **L1IP[1:0]**: L1 instruction cache policy
 Indicates the indexing and tagging policy for the L1 instruction cache.
 0x2: Virtually Indexed Physically Tagged (VIPT)

Bits 13:4 Reserved, must be kept at reset value.

Bits 3:0 **IMINLINE[3:0]**: Minimum instruction cache line.
 Number of words in the smallest cache line of all the instruction caches that the processor controls.
 0x3: 8 words

DBG processor TLB type register (DBG_TLBTR)

Address offset: 0xD0C

Reset value: 0x0000 0000

Res.	Res.	Res.	Res.	CLUSTERID[3:0]				Res.	Res.	Res.	Res.	Res.	Res.	CPUID[1:0]	
				r	r	r	r							r	r

Bit 31 Reserved, must be kept at reset value.

Bit 30 **U**: Uniprocessor system
 0: Processor is part of a multi-processor system

Bits 29:25 Reserved, must be kept at reset value.

Bit 24 **MT**: Multi-threading.
 Indicates whether the lowest level of affinity consists of logical processors that are implemented using a multi-threading type approach.
 0: Processor is part of a multi-processor system

Bits 23:12 Reserved, must be kept at reset value.

Bits 11:8 **CLUSTERID[3:0]**: CLUSTERID configuration.

Indicates the value read in the CLUSTERID configuration pin. It identifies each Cortex-A7 MPCore processor in a system with more than one processor present.

Bits 7:2 Reserved, must be kept at reset value.

Bits 1:0 **CPUID[1:0]**: Processor number.

For two processors, the CPU IDs are 0x0 and 0x1.

DBG revision ID register (DBG_REVIDR)

Address offset: 0xD18

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:12 **STATE3[3:0]**: Support for Thumb execution environment (ThumbEE) instruction set.

1: ThumbEE instruction set implemented

Bits 11:8 **STATE2[3:0]**: Support for Jazelle extension.

1: Processor supports trivial implementation of Jazelle extension

Bits 7:4 **STATE1[3:0]**: Support for Thumb instruction set.

3: Processor supports Thumb encoding after the introduction of Thumb-2 technology, and for all 16-bit and 32-bit Thumb basic instructions.

Bits 3:0 **STATE0[3:0]**: Support for Arm® instruction set.

1: Processor supports Arm® instruction set

DBG processor feature 1 register (DBG_PFR1)

Address offset: 0xD24

Reset value: 0x0001 1011

r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:16 **GENTIMEXT[3:0]**: Generic timer.

1: Processor supports generic timer

Bits 15:12 **VIRTEXT[3:0]**: Virtualisation extensions.

1: Processor supports virtualisation extensions

Bits 11:8 **MPPM[3:0]**: M profile programmers model.

0: Processor does not support microprocessor programmers model

Bits 7:4 **SECEXT[3:0]**: Security extensions.

1: Processor supports security extensions

Bits 3:0 **PROGMOD[3:0]**: Programmers model.

1: Processor supports the standard programmers model for Arm[®]v4 and later

DBG feature 0 register (DBG_DFR0)

Address offset: 0xD28

Reset value: 0x0201 0555

r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:28 Reserved, must be kept at reset value.

Bits 27:24 **PMUEXT[3:0]**: Performance monitor model.

2: Processor supports Performance monitor unit version 2 (PMUv2) architecture

Bits 23:20 **MPDBGMOD[3:0]**: Debug model, M profile.

0: Processor does not support M profile debug architecture

Bits 19:16 **MMTMOD[3:0]**: Memory mapped trace model.

1: Processor supports Arm[®] trace architecture, with memory mapped access

Bits 15:12 **CTMOD[3:0]**: Coprocessor trace model

0: Processor does not support Arm[®] trace architecture, with CP14 access

- Bits 11:8 **MMDBGMOD[3:0]**: Memory mapped debug model.
5: Processor supports v7.1 debug architecture, with memory mapped access
- Bits 7:4 **CSDBGMOD[3:0]**: Coprocessor secure debug model.
1: Processor supports v7.1 debug architecture, with CP14 access
- Bits 3:0 **CDBGMOD[3:0]**: Coprocessor debug model.
1: Processor supports v7.1 debug architecture, with CP14 access

DBG processor memory model feature 0 register (DBG_MMFR0)

Address offset: 0xD30

Reset value: 0x1010 1105

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

- Bits 31:28 **INNERSH[3:0]**: Innermost shareability.
1: Processor implements hardware coherency support
- Bits 27:24 **FCSE[3:0]**: Fast context switch extension.
0: Processor does not support FCSE
- Bits 23:20 **AUXREGS[3:0]**: Auxiliary registers.
1: Processor supports the auxiliary control register only
- Bits 19:16 **TCM[3:0]**: TCM and associated DMA.
0: Processor does not support TCM
- Bits 15:12 **SHLVLS[3:0]**: Shareability levels
1: Processor implements two levels of shareability
- Bits 11:8 **OUTERSH[3:0]**: Outermost shareability
1: Processor supports hardware coherency
- Bits 7:4 **PMSA[3:0]**: Protected memory system architecture.
1: Processor does not support PMSA
- Bits 3:0 **VMSA[3:0]**: Virtual memory system architecture.
1: Processor supports: VMSAv7 with support for remapping and the access flag; Privileged execute never (PXN) within the first level descriptors; 64-bit address translation descriptors

DBG processor memory model feature 1 register (DBG_MMFR1)

Address offset: 0xD34

Reset value: 0x4000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

- Bits 31:28 **HWACFLG[3:0]**: Hardware access flag.
0: Not supported
- Bits 27:24 **WFISTALL[3:0]**: Wait for interrupt stalling.
1: Processor supports WFI stalling
- Bits 23:20 **MEMBARR[3:0]**: Memory barrier.
2: Processor supports: Data synchronisation barrier (DSB); Instruction synchronisation barrier (ISB); Data memory barrier (DMB)

- Bits 19:16 **UNIFTLB[3:0]**: Unified TLB maintenance operations.
 - 4: Processor supports: Invalidate all entries in TLB; Invalidate TLB entry by MVA; Invalidate TLB entries by ASID match; Invalidate TLB entries by MVA all ASID; Invalidate unified hyp TLB entry by MVA; Invalidate entire non-secure non-hyp unified TLB; Invalidate entire hyp unified TLB
- Bits 15:12 **HVDTLB[3:0]**: Harvard TLB maintenance operations.
 - 0: Not supported
- Bits 11:8 **L1HRANGE[3:0]**: L1 Harvard cache maintenance operation range
 - 0: Not supported
- Bits 7:4 **L1HBGFTCH[3:0]**: L1 Harvard cache background prefetch operations
 - 0: Not supported
- Bits 3:0 **L1HFGFTCH[3:0]**: L1 Harvard cache foreground prefetch operations

DBG processor memory model feature 3 register (DBG_MMFR3)

Address offset: 0xD3C

Reset value: 0x0210 2211

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
SUPERSECT[3:0]				CMEMSIZE[3:0]				COHWALK[3:0]				Res.	Res.	Res.	Res.

r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

- Bits 31:28 **SUPERSECT[3:0]**: Supersection support.
 - 0: Processor supports supersections
- Bits 27:24 **CMEMSIZE[3:0]**: Cache physical memory size.
 - 2: Caches support 40-bit memory address
- Bits 23:20 **COHWALK[3:0]**: Coherent walk.
 - 1: Updates to the translation tables do not require a clean to the point of unification to ensure visibility by subsequent translation table walks.
- Bits 19:16 Reserved, must be kept at reset value.
- Bits 15:12 **MAINTBCST[3:0]**: Maintenance broadcast
 - 2: Cache, TLB and branch predictor operations affect structures according to shareability and defined behavior of instructions.
- Bits 11:8 **BPMAINT[3:0]**: Branch predictor maintenance.
 - 2: Processor supports: Invalidate entire branch predictor array; Invalidate branch predictor by MVA.
- Bits 7:4 **CMAINTSW[3:0]**: Cache maintenance by set/way.
 - 1: Processor supports: Invalidate data cache by set/way; Clean data cache by set/way; Clean and invalidate data cache by set/way.
- Bits 3:0 **CMAINTMVA[3:0]**: Cache maintenance by MVA
 - 1: Processor supports: Invalidate data cache by MVA; Clean data cache by MVA; Clean and invalidate data cache by MVA; Invalidate instruction cache by MVA; Invalidate all instruction cache entries.

DBG processor instruction set attribute 0 register (DBG_ISAR0)

Address offset: 0xD40

Reset value: 0x0210 1110

r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:28 Reserved, must be kept at reset value.

Bits 27:24 **DIVINST[3:0]**: Divide instructions.

2: Processor supports: SDIV and UDIV in the Thumb instruction set; SDIV and UDIV in the Arm® instruction set.

Bits 23:20 **DBGINST[3:0]**: Debug instructions.

1: Processor supports BKPT instruction

Bits 19:16 **COPROINST[3:0]**: Coprocessor instructions.

0: None supported, except for separately attributed architectures including CP15, CP14, and Advanced SIMD and VFP.

Bits 15:12 **CMPBRINST[3:0]**: Combined compare and branch instructions.

1: Processor supports CBNZ and CBZ instructions

Bits 11:8 **BITFLDINST[3:0]**: Bit field instructions.

1: Processor supports BFC, BFI, SBFX and UBFX instructions

Bits 7:4 **BITCNTINST[3:0]**: Bit count instructions.

1: Processor supports CLZ instruction

Bits 3:0 **SWAPINST[3:0]**: Swap instructions.

0: SWP and SWPB instructions supported fractionally

DBG processor instruction set attribute 1 register (DBG_ISAR1)

Address offset: 0xD44

Reset value: 0x1311 2111

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
JAZINST[3:0]				INTWKINST[3:0]				IMMINST[3:0]				IFTHENINST[3:0]

r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

- Bits 31:28 **JAZINST[3:0]**: Jazelle extension instructions.
1: Processor supports: BXJ instruction, and the J bit in the PSR
- Bits 27:24 **INTWKINST[3:0]**: Interworking instructions.
3: Processor supports: BX instruction, and the T bit in the PSR; BLX instruction, and PC loads have BX-like behavior; Data-processing instructions in the Arm® instruction set with the PC as the destination and the S bit cleared to 0, have BX-like behavior
- Bits 23:20 **IMMINST[3:0]**: Immediate instructions.
1: Processor supports: MOVN instruction; MOV instruction encodings with zero-extended 16-bit immediates; Thumb ADD and SUB instruction encodings with zero-extended 12-bit immediates, and other ADD, ADR, and SUB encodings cross-referenced by the pseudocode for those encodings.
- Bits 19:16 **IFTHEININST[3:0]**: Thumb If-then instructions.
1: Processor supports the IT instructions, and the IT bits in the PSRs
- Bits 15:12 **EXTNDINST[3:0]**: Extend instructions.
2: Processor supports: SXTB, SXTL, UXTB, and UXTH instructions; SXTB16, SXTAB, SXTAB16, SXTAH, UXTB16, UXTAB, UXTAB16, and UXTAH instructions
- Bits 11:8 **EXCARINST[3:0]**: A and R profile exception-handling instructions.
1: Processor supports SRS, RFE and CPS instructions
- Bits 7:4 **EXCINST[3:0]**: Exception-handling instructions.
1: Processor supports LDM (exception return), LDM (user registers), and STM (user registers) instructions
- Bits 3:0 **ENDIANINST[3:0]**: Endian instructions.
1: Processor supports SETEND instruction, and the E bit in the PSRs

DBG processor instruction set attribute 2 register (DBG_ISAR2)

Address offset: 0xD48

Reset value: 0x2123 2041

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
REVSALINST[3:0]				PSRINST[3:0]				MULTUINST[3:0]				MULTSINST[3:0]			
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MULTINST[3:0]				MULACINST[3:0]				MEMHTINST[3:0]				LDSTRINST[3:0]			
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

- Bits 31:28 **REVSALINST[3:0]**: Reversal instructions.
2: Processor supports REV, REV16, REVSH and RBIT instructions
- Bits 27:24 **PSRINST[3:0]**: PSR instructions.
1: Processor supports MRS and MSR instructions, and the exception return forms of data-processing instructions
- Bits 23:20 **MULTUINST[3:0]**: Advanced unsigned multiply instructions.
2: Processor supports UMULL, UMLAL, and UMAAL instructions

- Bits 19:16 **MULTSINST[3:0]**: Advanced signed multiply instructions.
 - 3: Processor supports: SMULL and SMLAL instructions; SMLABB, SMLABT, SMLALBB, SMLALBT, SMLALTB, SMLALTT, SMLATB, SMLATT, SMLAWB, SMLAWT, SMULBB, SMULBT, SMULTB, SMULTT, SMULWB, SMULWT instructions, and the Q bit in the PSRs; SMLAD, SMLADX, SMLALD, SMLALDX, SMLSD, SMLSDX, SMLSLD, SMLSLDX, SMMLA, SMMLAR, SMMLS, SMMLSR, SMMUL, SMMULR, SMUAD, SMUADX, SMUSD, and SMUSDX instructions
- Bits 15:12 **MULTINST[3:0]**: Additional multiply instructions.
 - 2: Processor supports MUL, MLA and MLS instructions
- Bits 11:8 **MULACINST[3:0]**: Interruptible multi-access instructions.
 - 0: None supported. This means that the processor does not support interruptible LDM and STM instructions
- Bits 7:4 **MEMHTINST[3:0]**: Memory hint instructions.
 - 4: Processor supports PLD, PLI (NOP), and PLDW instructions
- Bits 3:0 **LDSTRINST[3:0]**: Additional load/store instructions.
 - 1: Processor supports LDRD and STRD instructions

DBG processor instruction set attribute 3 register (DBG_ISAR3)

Address offset: 0xD4C

Reset value: 0x1111 2131

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
TEEXTINST[3:0]				TRNOPINST[3:0]				THCPYINST[3:0]				TABBRINST[3:0]			
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SYNPRIINST[3:0]				SVCINST[3:0]				SIMDINST[3:0]				SATINST[3:0]			
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

- Bits 31:28 **TEEXTINST[3:0]**: Thumb Execution Environment (ThumbEE) instructions.
 - 1: Processor supports ENTERX and LEAVEX instructions, and modifies the load behavior to include null checking
- Bits 27:24 **TRNOPINST[3:0]**: True NOP instructions.
 - 1: Processor supports true NOP instructions in both the Arm® and Thumb instruction sets, and the capability for additional NOP-compatible hints
- Bits 23:20 **THCPYINST[3:0]**: Thumb copy instructions.
 - 1: Processor supports Thumb instruction set encoding T1 of the MOV (register) instruction, copying from a low register to a low register
- Bits 19:16 **TABBRINST[3:0]**: Table branch instructions.
 - 1: Processor supports TBB and TBH instructions
- Bits 15:12 **SYNPRIINST[3:0]**: Synchronisation primitive instructions.
 - 2: Processor supports: LDREX and STREX instructions; CLREX, LDREXB, LDREXH, STREXB, and STREXH instructions; LDREXD and STREXD instructions

Bits 11:8 **SVCINST[3:0]**: SVC instructions.

1: Processor supports SVC instruction

Bits 7:4 **SIMDINST[3:0]**: Single instruction multiple data (SIMD) instructions.

3: Processor supports: SSAT and USAT instructions, and the Q bit in the PSRs; PKHBT, PKHTB, QADD16, QADD8, QASX, QSUB16, QSUB8, QSAX, SADD16, SADD8, SASX, SEL, SHADD16, SHADD8, SHASX, SHSUB16, SHSUB8, SHSAX, SSAT16, SSUB16, SSUB8, SSAX, SXTAB16, SXTB16, UADD16, UADD8, UASX, UHADD16, UHADD8, UHASX, UHSUB16, UHSUB8, UHSAX, UQADD16, UQADD8, UQASX, UQSUB16, UQSUB8, UQSAX, USAD8, USADA8, USAT16, USUB16, USUB8, USAX, UXTAB16, UXTB16 instructions, and the GE[3:0] bits in the PSRs

Bits 3:0 **SATINST[3:0]**: Saturate instructions.

1: Processor supports QADD, QDADD, QDSUB, QSUB and the Q bit in the PSRs

DBG processor instruction set attribute 4 register (DBG_ISAR4)

Address offset: 0xD50

Reset value: 0x1001 1142

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
SWPFRAC[3:0]				PSRMINST[3:0]				SPINSFRAC[3:0]				BARRINST[3:0]			
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SMCINST[3:0]				WRBKINST[3:0]				WSHFTINST[3:0]				UNPRIVINST[3:0]			
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:28 **SWPFRAC[3:0]**: Support for the memory system locking the bus for SWP or SWPB instructions:

1: Processor supports SWP and SWPB instruction but only in a uniprocessor context. SWP and SWPB do not guarantee whether memory accesses from other masters can come between the load memory access and the store memory access of the SWP or SWPB instruction

Bits 27:24 **PSRMINST[3:0]**: M profile instructions to modify the PSRs.

0: None supported

Bits 23:20 **SPINSFRAC[3:0]**: Synchronisation primitive instructions.

0: Processor supports: LDREX and STREX instructions; CLREX, LDREXB, LDREXH, STREXB, and STREXH instructions; LDREXD and STREXD instructions

Bits 19:16 **BARRINST[3:0]**: Barrier instructions.

1: Processor supports DMB, DSB and ISB instructions

Bits 15:12 **SMCINST[3:0]**: SMC instructions.

1: Processor supports SMC instruction

Bits 11:8 **WRBKINST[3:0]**: Write-back addressing modes.

1: Processor supports all Write-Back addressing modes defined in Arm®v7 architecture

Bits 7:4 **WSHFTINST[3:0]**: Instructions with shifts.

4: Processor supports: Shifts of loads and stores over the range LSL 0-3; Constant shift options, both on load/store and other instructions; Register-controlled shift options.

Bits 3:0 **UNPRIVINST[3:0]**: Unprivileged instructions.

2: Processor supports: LDRBT, LDRT, STRBT, and STRT instructions; LDRHT, LDRSBT, LDRSHT, and STRHT instructions.

DBG claim tag set register (DBG_CLAIMSET)

Address offset: 0xFA0

Reset value: 0x0000 00FF

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

								r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **CLR[7:0]**: Reset claim tag bits

Write:

00000000: No effect

xxxxxxx1: Clear bit 0

xxxxxx1x: Clear bit 1

xxxxx1xx: Clear bit 2

xxxx1xxx: Clear bit 3

...etc.

Read: Returns current value of claim tag

DBG lock access register (DBG_LAR)

Address offset: 0xFB0

Reset value: 0xFFFF XXXX

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
KEY[31:16]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
KEY[15:0]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w

Bits 31:0 **KEY[31:0]**: DBG register write access

Enables write access to some DBG registers by processor cores (debuggers do not need to unlock the component)

0xC5ACCE55: Enable write access

Other values: Disable write access

DBG lock status register (DBG_LSR)

Address offset: 0xFB4

Reset value: 0x0000 0003

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	NTT	SLK	SLI
													r	r	r

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **NTT**: Size of the DBG_LAR register
 0: 32-bit

Bit 1 **SLK**: Current status of lock
 This bit always returns zero when read by an external debugger.
 0: Write access is permitted
 1: Write access is blocked. Only read access is permitted.

Bit 0 **SLI**: Existence of lock control mechanism
 The bit indicates whether a lock control mechanism exists. It always returns zero when read by an external debugger.
 0: No lock control mechanism exists
 1: Lock control mechanism is implemented

DBG authentication status register (DBG_AUTHSTAT)

Address offset: 0xFB8

Reset value: 0x0000 000A

r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:28 **CIDMASK[3:0]**: Context ID matching breakpoint masking
 0x0: Not implemented

Bits 27:24 **AUXREGS[3:0]**: Debug external auxiliary control register.
 0x1: The processor supports debug external auxiliary control register

Bits 23:20 **DOUBLELOCK[3:0]**: Debug OS double lock register.
 0x1: The processor supports debug OS double lock register

Bits 19:16 **VIREXTNS[3:0]**: Virtualisation extensions.
 0x1: The processor implements the Virtualization Extensions to the Debug architecture

Bits 15:12 **VECTORCATCH[3:0]**: Vector catch event.
 0x0: The processor implements address matching form of vector catch

Bits 11:8 **BPADDRMASK[3:0]**: Immediate Virtual Address (IVA) matching breakpoint masking.
 0xF: Not implemented

Bits 7:4 **WPADDRMASK[3:0]**: DVA matching watchpoint masking.
 0x1: Watchpoint address mask implemented

Bits 3:0 **PCSAMPLE[3:0]**: Program Counter sampling using debug registers 40, 41, and 42.
 0x3: DBGPCSR, DBGCIDSR and DBGVIDSR are implemented as debug registers 40, 41 and 42

For the debug unit register descriptions, refer to the *Cortex®-A7 MPCore Technical Reference Manual [9]*.

66.11.2 Cortex®-A7 performance monitoring unit (PMU)

The Performance Monitoring Unit contains four 32-bit event counters, and one processor clock cycle counter. The event counters can be configured to increment every time a specified event occurs. Examples of events that can be counted include:

- Cache hit/miss
- Data load/store
- Bus access
- Interrupt exception
- ETM external trigger output
- Snoop transaction
- Software increment

When a counter wraps, it can generate an interrupt on PMUIRQ. This interrupt is connected to the CTI so can halt the processor(s), start or stop trace, etc.

Most of the events are connected to the ETM via the PMUEVENTS bus. This allows the resources of the ETM to be used to filter the events. The filtered events are returned to the PMU via the two EXTOUT outputs of the ETM.

For a list of PMU events and the corresponding line of the PMUEVENTS bus, refer to the *Cortex®-A7 MPCore Technical Reference Manual [9]*.

Performance monitoring unit registers

The Performance Monitoring Unit registers are accessed by the debugger via the debug APB, at address 0xE00D 1000 to 0xE00D 1FFC for the CA7-CPU1 PMU, and 0xE00D 3000 to 0xE00D 3FFC for the CA7-CPU2. The same registers are accessible by software at addresses 0x500D 1000 to 0x500D 1FFC and 0x500D 3000 to 0x500D 3FFC respectively.

Each CPU can also access the registers of its own PMU via CP15 registers.

For the PMU register descriptions, refer to the *Cortex®-A7 MPCore Technical Reference Manual [9]*.

PMU event count x register (PM_XEVCNTRx)

Address offset: 0x000 + 0x4 *x, (x = 0 to 3)

Reset value: 0xXXXX XXXX

Read or write the value of the selected event counter, PMNn, where n = 0..3.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
PMN[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
PMN[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **PMN[31:0]**: Event counter value.

PMU cycle count register (PM_CCNTR)

Address offset: 0x07C

Reset value: 0x0000 0000

Holds the value of the processor cycle counter.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
CCNT[31:16]

CCNT[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **CCNT[31:0]**: Cycle count.

Cycle count. Depending on the value of PM_CR.D, this field increments either once every processor clock cycle or once every 64 processor clock cycles.

PMU event type select x register (PM_XEVTYPEPx)

Address offset: 0x400 + 0x4 * x, (x = 0 to 3)

Reset value: 0x0XXX XXXX

Controls which events increment the corresponding event counter, and in which modes.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

								rw	rw	rw	rw	rw	rw	rw	rw		

- Bit 31 **P**: Privileged execution filtering.
 - 0: Count events when executing at PL1
 - 1: Do not count events when executing at PL1
- Bit 30 **U**: Unprivileged execution filtering.
 - 0: Count events when executing at PL0
 - 1: Do not count events when executing at PL0
- Bit 29 **NSK**: Non-secure PL1 control bit.
 - Controls counting when executing in Non-secure state at PL1. The behavior depends on the combined values of the P and NSK bits:
 - P=NSK: In Non-secure state, count events when executing at PL1
 - P!=NSK: In Non-secure state, do not count events when executing at PL1
- Bit 28 **NSU**: Non-secure unprivileged control bit.
 - Controls counting in when executing in Non-secure at PL0. The behavior depends on the combined values of the U and NSU bits:
 - U=NSU: In Non-secure state, count events when executing at PL0
 - U!=NSU: In Non-secure state, do not count events when executing at PL0
- Bit 27 **NSH**: Non-secure PL2 enable.
 - 0: In Non-secure state, do not count events when executing at PL2
 - 1: In Non-secure state, count events when executing at PL2
- Bits 26:8 Reserved, must be kept at reset value.
- Bits 7:0 **EVTCOUNT[7:0]**: Event to count.
 - The event number of the event that is counted by the corresponding event counter, PMNn where n = 0..3

PMU event type select 31 register (PM_XEVTYPER31)

Address offset: 0x47C

Reset value: 0x0XXX XXXX

Controls in which modes the cycle counter increments.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
P	U	NSK	NSU	NSH	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

- Bit 31 **P**: Privileged execution filtering.
 0: Count cycles when executing at PL1
 1: Do not count cycles when executing at PL1
- Bit 30 **U**: Unprivileged execution filtering.
 0: Count cycles when executing at PL0
 1: Do not count cycles when executing at PL0
- Bit 29 **NSK**: Non-secure PL1 control bit.
 Controls counting when executing in Non-secure state at PL1. The behavior depends on the combined values of the P and NSK bits:
 P=NSK: In Non-secure state, count cycles when executing at PL1
 P!=NSK: In Non-secure state, do not count cycles when executing at PL1
- Bit 28 **NSU**: Non-secure unprivileged control bit.
 Controls counting in when executing in Non-secure at PL0. The behavior depends on the combined values of the U and NSU bits:
 U=NSU: In Non-secure state, count cycles when executing at PL0
 U!=NSU: In Non-secure state, do not count cycles when executing at PL0
- Bit 27 **NSH**: Non-secure PL2 enable.
 0: In Non-secure state, do not count cycles when executing at PL2
 1: In Non-secure state, count cycles when executing at PL2

Bits 26:0 Reserved, must be kept at reset value.

PMU count enable set register (PM_CNTENSET)

Address offset: 0xC00

Reset value: 0xXXXX XXXX

Enables the cycle counter and event counters, PMN0..3.

 - 0: no overflow occurred (read), no effect (write)
 - 1: overflow occurred (read), reset overflow bit (write)
- Bit 0 **P0**: Event counter 0 overflow.
 - 0: no overflow occurred (read), no effect (write)
 - 1: overflow occurred (read), reset overflow bit (write)

PMU software increment register (PM_SWINC)

Address offset: 0xCA0

Reset value: 0xFFFF XXXX

Increments a counter that is configured to count the software increment event, event 0x00.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	P3	P2	P1	P0
												w	w	w	w

Bits 31:4 Reserved, must be kept at reset value.

Bit 3 **P3**: Event counter 3 increment.

- 0: No effect
- 1: Increment counter by 1

Bit 2 **P2**: Event counter 2 increment.

- 0: No effect
- 1: Increment counter by 1

Bit 1 **P1**: Event counter 1 increment.

- 0: No effect
- 1: Increment counter by 1

Bit 0 **P0**: Event counter 0 increment.

- 0: No effect
- 1: Increment counter by 1

PMU configuration register (PM_CFGR)

Address offset: 0xE00

Reset value: 0xXXX9 DF04

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	UEN	Res.	Res.	EX

CCD	CC	SIZE[5:0]						N[7:0]							
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:20 Reserved, must be kept at reset value.

Bit 19 **UEN**: User-mode enable register.

- 1: User-mode enable register implemented

Bits 18:17 Reserved, must be kept at reset value.

Bit 16 **EX**: Export.

- 1: Export is supported

Bit 15 **CCD**: Cycle counter divider.

- 1: Cycle counter divider implemented

Bit 14 **CC**: Cycle counter.
 1: Cycle counter implemented

Bits 13:8 **SIZE[5:0]**: Counter size.
 0x1F: 32-bit counters

Bits 7:0 **N[7:0]**: Number of event counters.
 0x04: Four event counters

PMU control register (PM_CR)

Address offset: 0xE04

Reset value: 0x4107 2000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
IMP[7:0]								IDCODE[7:0]							
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
N[4:0]					Res.	Res.	Res.	Res.	Res.	DP	X	D	C	P	E
r	r	r	r	r						rw	rw	rw	w	w	rw

Bits 31:24 **IMP[7:0]**: Implementer code.
 0x41: Arm®

Bits 23:16 **IDCODE[7:0]**: Identification code.
 0x07: Cortex-A7 MP core

Bits 15:11 **N[4:0]**: Number of event counters.
 In Secure state and Hyp mode, this field returns 0x4 that indicates the number of counters implemented.
 In Non-secure modes other than Hyp mode, this field reads the value of the processor HDCR.HPMN register field.

Bits 10:6 Reserved, must be kept at reset value.

Bit 5 **DP**: Disable cycle counter in prohibited regions.
 0: Counter is enabled in prohibited regions
 1: Counter is disabled in prohibited regions

Bit 4 **X**: Export enable.
 This bit permits events to be exported to another debug device, such as a trace macrocell, over an event bus:
 0: Export of events is disabled
 1: Export of events is enabled

Bit 3 **D**: Clock divider.
 0: Cycle counter counts every clock cycle
 1: Cycle counter counts once every 64 clock cycles

Bit 2 **C**: Clock counter reset.

- 0: No effect
- 1: Reset cycle counter to 0

Bit 1 **P**: Event counter reset.

- 0: No effect
- 1: Reset all event counters to 0

Bit 0 **E**: Enable.

- 0: All counters, including the cycle counter, are disabled
- 1: All counters are enabled

PMU user enable register (PM_USERENR)

Address offset: 0xE08

Reset value: 0xFFFF XXXX

Bits 31:30 Reserved, must be kept at reset value.

- Bit 29 **EVENTID29**: Event ID 0x1D user mode access enable
Event number 0x1D corresponds to event:
“Bus cycle”.
0: Event implemented
1: Event not implemented
- Bit 28 **EVENTID28**: Event ID 0x1C user mode access enable
Event number 0x1C corresponds to event:
“Instruction architecturally executed, condition code check pass, write to TTBR”.
0: Event implemented
1: Event not implemented
- Bit 27 **EVENTID27**: Event ID 0x1B user mode access enable
Event number 0x1B corresponds to event:
“Instruction speculatively executed”.
0: Event implemented
1: Event not implemented
- Bit 26 **EVENTID26**: Event ID 0x1A user mode access enable
Event number 0x1A corresponds to event
“Local memory error”.
0: Event implemented
1: Event not implemented
- Bit 25 **EVENTID25**: Event ID 0x19 user mode access enable
Event number 0x19 corresponds to event:
“Bus access”.
0: Event implemented
1: Event not implemented
- Bit 24 **EVENTID24**: Event ID 0x18 user mode access enable
Event number 0x18 corresponds to event:
“Level 2 data cache write-back”.
0: Event implemented
1: Event not implemented
- Bit 23 **EVENTID23**: Event ID 0x17 user mode access enable
Event number 0x17 corresponds to event:
“Level 2 data cache refill”.
0: Event implemented
1: Event not implemented
- Bit 22 **EVENTID22**: Event ID 0x16 user mode access enable
Event number 0x16 corresponds to event:
“Level 2 data cache access”.
0: Event implemented
1: Event not implemented
- Bit 21 **EVENTID21**: Event ID 0x15 user mode access enable
Event number 0x15 corresponds to event:
“Level 1 data cache write-back”.
0: Event implemented
1: Event not implemented

- Bit 20 **EVENTID20**: Event ID 0x14 user mode access enable
Event number 0x14 corresponds to event:
“Level 1 instruction cache access”.
0: Event implemented
1: Event not implemented
- Bit 19 **EVENTID19**: Event ID 0x13 user mode access enable
Event number 0x13 corresponds to event:
“Data memory access”.
0: Event implemented
1: Event not implemented
- Bit 18 **EVENTID18**: Event ID 0x12 user mode access enable
Event number 0x12 corresponds to event:
“Predictable branch speculatively executed”.
0: Event implemented
1: Event not implemented
- Bit 17 **EVENTID17**: Event ID 0x11 user mode access enable
Event number 0x11 corresponds to event:
“Cycle”.
0: Event implemented
1: Event not implemented
- Bit 16 **EVENTID16**: Event ID 0x10 user mode access enable
Event number 0x10 corresponds to event:
“Mispredicted or not predicted branch speculatively executed”.
0: Event implemented
1: Event not implemented
- Bit 15 **EVENTID15**: Event ID 0xF user mode access enable
Event number 0xF corresponds to event
“Instruction architecturally executed, condition code check pass, unaligned load or store”.
0: Event implemented
1: Event not implemented
- Bit 14 **EVENTID14**: Event ID 0xE user mode access enable
Event number 0xE corresponds to event:
“Instruction architecturally executed, condition code check pass, procedure return”.
0: Event implemented
1: Event not implemented
- Bit 13 **EVENTID13**: Event ID 0xD user mode access enable
Event number 0xD corresponds to event:
“Instruction architecturally executed, immediate branch”.
0: Event implemented
1: Event not implemented
- Bit 12 **EVENTID12**: Event ID 0xC user mode access enable
Event number 0xC corresponds to event:
“Instruction architecturally executed, condition code check pass, software change of the PC”.
0: Event implemented
1: Event not implemented

- Bit 11 **EVENTID11**: Event ID 0xB user mode access enable
Event number 0xB corresponds to event:
“Instruction architecturally executed, condition code check pass, write to CONTEXTIDR”.
0: Event implemented
1: Event not implemented
- Bit 10 **EVENTID10**: Event ID 0xA user mode access enable
Event number 0xA corresponds to event:
“Instruction architecturally executed, condition code check pass, exception return”.
0: Event implemented
1: Event not implemented
- Bit 9 **EVENTID9**: Event ID 0x9 user mode access enable
Event number 0x9 corresponds to event:
“Exception taken”.
0: Event implemented
1: Event not implemented
- Bit 8 **EVENTID8**: Event ID 0x8 user mode access enable
Event number 0x8 corresponds to event:
“Instruction architecturally executed”.
0: Event implemented
1: Event not implemented
- Bit 7 **EVENTID7**: Event ID 0x7 user mode access enable
Event number 0x7 corresponds to event:
“Instruction architecturally executed, condition code check pass, store”.
0: Event implemented
1: Event not implemented
- Bit 6 **EVENTID6**: Event ID 0x6 user mode access enable
Event number 0x6 corresponds to event:
“Instruction architecturally executed, condition code check pass, load”.
0: Event implemented
1: Event not implemented
- Bit 5 **EVENTID5**: Event ID 0x5 user mode access enable
Event number 0x5 corresponds to event:
“Level 1 data TLB refill”.
0: Event implemented
1: Event not implemented
- Bit 4 **EVENTID4**: Event ID 0x4 user mode access enable
Event number 0x4 corresponds to event:
“Level 1 data cache access”.
0: Event implemented
1: Event not implemented
- Bit 3 **EVENTID3**: Event ID 0x3 user mode access enable
Event number 0x3 corresponds to event:
“Level 1 data cache refill”.
0: Event implemented
1: Event not implemented

Bit 2 **EVENTID2**: Event ID 0x2 user mode access enable

Event number 0x2 corresponds to event:
 “Level 1 instruction TLB refill”.
 0: Event implemented
 1: Event not implemented

Bit 1 **EVENTID1**: Event ID 0x1 user mode access enable

Event number 0x1 corresponds to event:
 “Level 1 instruction cache refill”.
 0: Event implemented
 1: Event not implemented

Bit 0 **EVENTID0**: Event ID 0x0 user mode access enable

Event number 0x0 corresponds to event:
 “Instruction architecturally executed, condition code check pass, software increment”.
 0: Event implemented
 1: Event not implemented

PMU lock access register (PM_LAR)

Address offset: 0xFB0

Reset value: 0xFFFF XXXX

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
KEY[31:16]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
KEY[15:0]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w

Bits 31:0 **KEY[31:0]**: PMU register write access

Enables write access to some PMU registers by processor cores
 0xC5ACCE55: Enable write access
 Other values: Disable write access

PMU lock status register (PM_LSR)

Address offset: 0xFB4

Reset value: 0x0000 0003

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	NTT	SLK	SLI
													r	r	r

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **NTT**: Size of the PM_LAR register
 0: 32-bit

Bit 1 **SLK**: Current status of lock
 0: Write access is permitted
 1: Write access is blocked. Only read access is permitted.

Bit 0 **SLI**: Existence of lock control mechanism
 The bit indicates whether a lock control mechanism exists.
 0: No lock control mechanism exists
 1: Lock control mechanism is implemented

PMU authentication status register (PM_AUTHSTAT)

Address offset: 0xFB8

Reset value: 0XXXXX XXXX

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bit 7 **SNI**: Secure non-invasive debug
 1: Secure non-invasive debug features implemented

Bit 6 **SNE**: Secure non-invasive debug enabled
 0: Non-invasive debug is not permitted in secure PL1 modes
 1: Non-invasive debug is permitted in secure PL1 modes

Bit 5 **SI**: Secure invasive debug
 0: Secure invasive debug features not implemented

Bit 4 **SE**: Secure invasive debug enabled
 0: Invasive halting debug is not permitted in secure PL1 modes

Bit 3 **NSNI**: Non-secure non-invasive debug
 1: Non-secure non-invasive debug features implemented

Bit 2 **NSNE**: Non-secure non-invasive debug enabled
 0: Non-secure non-invasive debug is not permitted
 1: Non-secure non-invasive debug is permitted

Bit 1 **NSI**: Non-secure invasive debug
 0: Non-secure invasive debug features not implemented

Bit 0 **NSE**: Non-secure invasive debug enabled
 0: Non-secure invasive debug is not permitted

PMU CoreSight device type register (PM_DEVTYPE)

Address offset: 0xFCC

Reset value: 0x0000 0016

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

66.11.3 Embedded trace macrocell (ETM)

The Cortex[®]-A7 ETM is a CoreSight[™] component closely coupled to the CPU. There are two ETM units, one for each CA7 core. The ETM generates trace packets that allow the execution of the Cortex[®]-A7 core to be traced. Both instruction execution and data accesses can be traced.

The ETM receives information from the CPU over the processor trace interface, including:

- The number of instructions executed in the same cycle
- Changes in program flow
- The current processor instruction state
- The addresses of memory locations accessed by load and store instructions
- The type, direction and size of a transfer
- Condition code information
- Exception information
- Wait for interrupt state information

For more information, refer to the *Arm[®] CoreSight[™] ETM[™]-A7 technical reference manual [6]*.

Embedded trace macrocell registers

The ETM registers are accessed by the debugger via the debug APB, at address range 0xE00D C000 to 0xE00D CFFC. They are accessible by software at address range 0x500D C000 to 0x500D CFFC.

For the ETM register descriptions, refer to the *Arm[®] CoreSight[™] ETM[™]-A7 technical reference manual [6]*.

ETM control register (ETM_CR)

Address offset: 0x000

Reset value: 0x0000 0461

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	VMIDT RCEN	Res.	TSEN	PROCSEL[2:0]			Res.	Res.	Res.	PORT SIZE[3]	DATAONLY	FILTER CPRT	SUPPD ATA	PORTMODE[1:0]	
	rw		rw	rw	rw	rw				r	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CONXTIDSIZ[1:0]		PORT MODE [2]	CYCLE ACC	ETMP ORTSE L	ETMPR OG	DBGR QCTL	BRANC HOUTP UT	Res.	PORTSIZE[2:0]			DATAACC[1:0]		MONIT ORCP RT	ETMPD N
rw	rw	rw	rw	rw	rw	rw	rw		r	r	r	rw	rw	rw	rw

- Bit 31 Reserved, must be kept at reset value.
- Bit 30 **VMIDTRCEN**: VMID trace enable
0: VMID tracing disabled
1: VMID tracing enabled
- Bit 29 Reserved, must be kept at reset value.
- Bit 28 **TSEN**: Timestamping enable
0: Timestamping disabled
1: Timestamping enabled
- Bits 27:25 **PROCSEL[2:0]**: Processor select.
0: Select CPU0 to trace
1: Select CPU1 to traceReserved
2: Reserved
3: Reserved
- Bits 24:22 Reserved, must be kept at reset value.
- Bit 20 **DATAONLY**: Data-only mode
0: Instruction trace enabled
1: Data-only tracing enabled
- Bit 19 **FILTERCPRT**: Filter co-processor register transfers
If MONITORCPRT = 0, this bit should be set to 0.
If MONITORCPRT = 1, this bit has the following effect:
0: All CPRT's traced
1: CPRT's only traced when ViewData is active.
- Bit 18 **SUPPDATA**: Enable data suppression
0: Do not suppress data
1: Suppress data when FIFO empty count < ETMFFLR.FIFOFULLVL
- Bits 15:14 **CONXTIDSIZE[1:0]**: Context ID size.
0: No context ID tracing
1: Context ID bits [7:0] traced
2: Context ID bits [15:0] traced
3: Context ID bits [31:0] traced
- Bits 13, 17:16 **PORTMODE[2:0]**: Set trace port clocking mode
Setting PORTMODE[2:0] to any value selects dynamic mode.
- Bit 12 **CYCLEACC**: Cycle accurate tracing
0: Disabled
1: Enabled. Include a precise cycle count of executed instructions
- Bit 11 **ETMPORTSEL**: Control state of ETMEN output
0: ETMEN is low
1: ETMEN is high
This bit must be set to 1 to enable trace output
- Bit 10 **ETMPROG**: ETM programming
This bit must be set to 1 before programming the ETM. Tracing is prevented while this bit is set to 1.
0: ETM operational
1: ETM in programming state

- Bit 9 **DBGQCTL**: Debug request control.
 - 0: DBGQ output is not set on a trigger event.
 - 1: DBGQ output is set on a trigger event to force the processor into debug state
- Bit 8 **BRANCHOUTPUT**: Branch output
 - 0: Branch addresses not traced
 - 1: All branch addresses are output, even if the branch was because of a direct branch instruction. Setting this bit enables reconstruction of the program flow without having access to the memory image of the code being executed
- Bit 7 Reserved, must be kept at reset value.
- Bits 21, 6:4 **PORTSIZE[3:0]**: Port size
 - Setting PORTSIZE[3:0] to any value selects 64-bit port size.
- Bits 3:2 **DATAACC[1:0]**: Data access tracing mode.
 - 0: No data tracing
 - 1: Trace only the data portion of the access
 - 2: Trace only the address portion of the access
 - 3: Trace both the address and data of the access
- Bit 1 **MONITORCPRT**: Monitor co-processor register transfers
 - 0: CPRT's not traced
 - 1: CPRT's traced. If FILTERCPRT = 1, CPRT's are only traced when ViewData is active.
- Bit 0 **ETMPDN**: ETM power down
 - 0: ETM tracing is enabled
 - 1: ETM tracing is disabled, and ETM is in low power mode

ETM configuration code register (ETM_CCR)

Address offset: 0x004

Reset value: 0x8D29 4024

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

- Bit 31 **IDREG**: ETM ID register present
 - 1: ETMIDR register is present and defines the ETM architecture version in use
- Bits 30:28 Reserved, must be kept at reset value.
- Bit 27 **SWACC**: Co-processor and memory access
 - 1: Memory-mapped access to registers is supported
- Bit 26 **STARTSTOP**: Trace start/stop block present
 - 1: Trace start/stop block is present
- Bits 25:24 **CONXTIDCMP[1:0]**: Number of context ID comparators
 - 0x1: One context ID comparator implemented

- Bit 23 **FIFOFULL**: FIFOFULL logic present
0: FIFOFULL logic is not present in the ETM
- Bit 22 Reserved, must be kept at reset value.
- Bits 21:20 **EXTOUTPUTS[1:0]**: Number of external outputs
0x2: Two external outputs are supported
- Bits 19:17 **EXTINPUTS[2:0]**: Number of external inputs
0x4: Four external inputs are supported
- Bit 16 **SEQUENCER**: Sequencer present
1: The sequencer is present in the ETM.
- Bits 15:13 **COUNTERS[2:0]**: Number of counters
0x2: Two counters are implemented
- Bits 12:8 **MMAPDECS[4:0]**: Number of memory map decoders
0x0: No memory map decoder inputs are implemented.
- Bits 7:4 **DATAComps[3:0]**: Number of data value comparators
0x2: Two data value comparators are implemented.
- Bits 3:0 **ADCOMPPrs[3:0]**: Number of address comparator pairs
0x4: Four address comparator pairs are implemented.

ETM trigger register (ETM_TRIGGER)

Address offset: 0x008

Reset value: 0x0000 0000

FCN[1:0]		RESOURCEB[6:0]						RESOURCEA[6:0]							
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

- Bits 31:17 Reserved, must be kept at reset value.
- Bits 16:14 **FCN[2:0]**: Boolean function
If A is defined as the first resource match and B as the second match, an event is defined as a function of A and B.

 - 0x0: A
 - 0x1: NOT A
 - 0x2: A AND B
 - 0x3: NOT A AND B
 - 0x4: NOT A AND NOT B
 - 0x5: A OR B
 - 0x6: NOT A OR B
 - 0x7: NOT A OR NOT B
- Bits 13:7 **RESOURCEB[6:0]**: Second resource identifier
See RESOURCEA[6:0] field for bit description.

Bits 6:0 **RESOURCEA[6:0]**: First resource identifier

Bits [6:4] defines the resource type and bits [3:0] the index. The supported resource identifiers are listed below. Programming any other values may result in unpredictable behavior.

- 0x00: Single address comparator 1
- ...
- 0x0F: Single address comparator 16
- 0x10: Address range comparator 1
- ...
- 0x17: Address range comparator 8
- 0x18: Instrumentation resource 1
- 0x19: Instrumentation resource 2

- 0x40: Counter 1 at zero
- 0x41: Counter 2 at zero
- 0x42: Counter 3 at zero
- 0x43: Counter 4 at zero
- 0x50: Sequencer in states 1
- 0x51: Sequencer in states 2
- 0x52: Sequencer in states 3
- 0x58: Context ID comparator 1
- 0x5B: VMID comparator
- 0x5F: Trace start/stop resource
- 0x60: External inputs 1
- 0x61: External inputs 2
- 0x62: External inputs 3
- 0x63: External inputs 4
- 0x6D: Processor is in non-secure state
- 0x6E: Trace prohibited by processor
- 0x6F: Hard-wired input, always true
- Others: Reserved

ETM status register (ETM_SR)

Address offset: 0x010

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TRIG	STSTP RESST AT	PROG BIT	UNTRC DOVFL
												rw	rw	r	r

Bits 31:4 Reserved, must be kept at reset value.

Bit 3 **TRIG**: Trigger flag

Set when the trigger occurs, and prevents the trigger from being output until the ETM is programmed again.

Bit 2 **STSTPRESSTAT**: Trigger start/stop resource status

Holds the current status of the trace start/stop resource. If set to 1, it indicates that a trace on address has been matched, without a corresponding trace off address match.

Bit 1 **PROGBIT**: Programming bit value (read-only)

The current effective value of the ETM Programming bit, bit [10] of the ETM_CR. Set the programming bit to 1 and wait for this bit to go to 1 before programming the ETM.

This bit remains at 0 until the FIFO is empty, or if OS lock is set in the ETM_OSLSR register.

Bit 0 **UNTRCDOVFL**: Untraced overflow (read-only)

If set to 1, there is an overflow that has not yet been traced. This bit is cleared to 0 when trace is restarted, or when the ETM power-down bit (bit [0] of the ETM_CR register) is set to 1.

ETM configuration register (ETM_SCR)

Address offset: 0x014

Reset value: 0x0002 0D09

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

	r	r	r	r	r	r	r						r	r	r

Bits 31:18 Reserved, must be kept at reset value.

Bit 17 **NOFTCHCOMP**: No fetch comparisons

1: Fetch comparisons are not implemented

Bits 16:15 Reserved, must be kept at reset value.

Bits 14:12 **SUPPROC[2:0]**: Number of supported processors

0x0: One processor supported

Bit 11 **PMSUPP**: Port mode support

0: Current selected port mode is not supported

1: Current selected port mode is supported

Bit 10 **PSSUPP**: Port size support

0: Current selected port size is not supported

1: Current selected port size is supported

Bit 8 **FFSUPP**: FIFOFULL support
 0: FIFOFULL is not supported

Bits 7:3 Reserved, must be kept at reset value.

Bits 9, 2, 1, 0 **MAXPS[3:0]**: Maximum ETM port size field
 These bits indicate the maximum ETM port size supported.
 0x4: Maximum port size = 4
 Others: Reserved

ETM trace enable start/stop control register (ETM_SSCR)

Address offset: 0x018

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		
INCEXCMMDSEL[8:1]								INCEXCADCOMPSEL[8:1]									
r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w		

Bits 31:26 Reserved, must be kept at reset value.

Bit 25 **TSEEN**: Trace start/stop trace enable control
 0: Trace start/stop block does not control trace enable
 1: Trace enable is controlled by the trace start/stop block

Bit 24 **INCEXCCTL**: Trace start/stop trace enable control
 0: Include. The specified resources indicate the regions where tracing can occur. When outside this region tracing is prevented
 1: Exclude. The resources specified in bits 23:0 and in the ETMTECR2 register indicate regions to be excluded from the trace. When outside an exclude region, tracing can occur.

Bits 23:8 **INCEXCMMDSSEL[16:1]**: Memory map decode select bits for include/exclude control.
 Not used, there are no memory map decoders

Bits 7:0 **INCEXCADCOMPSEL[8:1]**: Address comparator select bits for include/exclude control.
 When bit n is set to 1, it selects address range comparator n for include/exclude control

ETM FIFOFULL level register (ETM_FFLR)

Address offset: 0x028

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16		
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.		
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	FIFOFULLVL[7:0]									
								rw	rw	rw	rw	rw	rw	rw	rw		

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **FIFOFULLVL[7:0]**: Threshold for FIFOFULL signal
 The number of bytes left in the FIFO, below which the SuppressData signal is asserted. For example, setting this value to 15 causes data trace suppression, if enabled, when there are less than 15 free bytes in the FIFO.

ETM view data event register (ETM_VDEVVR)

Address offset: 0x030

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:17 Reserved, must be kept at reset value.

Bits 16:14 **FCN[2:0]**: Boolean function

If A is defined as the first resource match and B as the second match, an event is defined as a function of A and B.

0x0: A
 0x1: NOT A
 0x2: A AND B
 0x3: NOT A AND B
 0x4: NOT A AND NOT B
 0x5: A OR B
 0x6: NOT A OR B
 0x7: NOT A OR NOT B

Bits 13:7 **RESOURCEB[6:0]**: Second resource identifier
 See RESOURCEA[6:0] field for bit description.

Bits 6:0 **RESOURCEA[6:0]**: First resource identifier

Bits [6:4] defines the resource type and bits [3:0] the index. The supported resource identifiers are listed below. Programming any other values may result in unpredictable behavior.

0x00: Single address comparator 1
 ...
 0x0F: Single address comparator 16
 0x10: Address range comparator 1
 ...
 0x17: Address range comparator 8
 0x18: Instrumentation resource 1
 0x19: Instrumentation resource 2
 0x1A: Instrumentation resource 3
 0x1B: Instrumentation resource 4
 0x20: Embedded-ICE watchpoint comparators 1 (from DWT)

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
VDINCSADCOMPSEL[16:1]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 **VDEXSADCOMPSEL[16:1]**: Single address comparator select bits for ViewData exclude control

When bit n is set to 1, it selects single address comparator n for exclude control.

Bits 15:0 **VDINCSADCOMPSEL[16:1]**: Single address comparator select bits for ViewData include control

When bit n is set to 1, it selects single address comparator n for include control.

ETM view data control 3 register (ETM_VDCR3)

Address offset: 0x03C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

VDEXCADCOMPSEL[8:1]								VDINCADCOMPSEL[8:1]							
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:17 Reserved, must be kept at reset value.

Bit 16 **EXONLY**: Exclude only

0: Mixed mode. ViewData operates in a mixed mode, and both include and exclude resources can be programmed

1: Exclude-only mode. ViewData is programmed only in an excluding mode. If none of the excluding resources match, tracing can occur

Bits 15:8 **VDEXCADCOMPSEL[8:1]**: Address range comparator select bits for ViewData exclude control

When bit n is set to 1, it selects address range comparator n for exclude control.

Bits 7:0 **VDINCADCOMPSEL[8:1]**: Address range comparator select bits for ViewData include control

When bit n is set to 1, it selects single address comparator n for include control.

ETM address comparator value x register (ETM_ACVRx)

Address offset: $0x040 + 0x4 * (x - 1)$, (x = 1 to 8)

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

VMID COMP	HYP MODE	STMODE[3:0]				CTXTIDCOMP [1:0]		EXACT MATCH	DCOMP[1:0]		COMPACCSIZE [1:0]		ACCTYPE[2:0]		
r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w

Bits 31:16 Reserved, must be kept at reset value.

Bit 15 **VMIDCOMP**: Virtual machine ID (VMID) comparison enable

A value of 1 means that the address comparator matches only if the current VMID matches the value stored in the ETM_VMIDCVR register

Bit 14 **HYPMODE**: Hyp mode comparison enable

A value of 1 means that the address comparator also matches if the processor is operating in Hyp mode

Bits 13:10 **STMODE[3:0]**: State and mode comparison control

Bits [3,1] control non-secure state comparison. Bits [2,0] control secure state comparison.

X0X0: Match in all modes in secure state

X0X1: Do not match in any modes in secure state

X1X0: Match in all modes except User mode in secure state

X1X1: Match only in User mode in secure state

0X0X: Match in all modes in non-secure state

0X1X: Do not match in any modes in non-secure state

1X0X: Match in all modes except User mode in non-secure state

1X1X: Match only in User mode in non-secure state

- Bits 9:8 **CTXTIDCOMP[1:0]**: Context ID comparator control.
 - 0: Ignore context ID comparator
 - 1: Address comparator matches only if context ID comparator value 1 matches
 - 2: Address comparator matches only if context ID comparator value 2 matches
 - 3: Address comparator matches only if context ID comparator value 3 matches
- Bit 7 **EXACTMATCH**: Exact match
 - 0: Comparator matches even for cancelled instructions, data transfer aborts or failed stores
 - 1: Comparator does not match for cancelled instructions, data transfer aborts or failed stores
- Bits 6:5 **DCOMP[1:0]**: Data value comparison control.
 - 0: No data value comparison is made
 - 1: Comparator can match only if data value matches
 - 2: Reserved
 - 3: Comparator can match only if data value does not match
- Bits 4:3 **COMPACCSIZE[1:0]**: Comparison access size.
 - 0: Java instruction or byte data
 - 1: Thumb instruction or halfword data
 - 2: Reserved
 - 3: Arm instruction or word data
- Bits 2:0 **ACCTYPE[2:0]**: Access type
 - 0: Instruction fetch (not supported)
 - 1: Instruction execute
 - 2: Instruction executed and passed condition code test
 - 3: Instruction executed and failed condition code test
 - 4: Data load or store
 - 5: Data load
 - 6: Data store
 - 7: Reserved

ETM data comparator value x register (ETM_DCVRx)

Address offset: 0x0C0 + 0x4 * (x - 1), (x = 1 to 3)

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
DATA[31:16]															
r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DATA[15:0]															
r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w

Bits 31:0 **DATA[31:0]**: Data value for comparison

ETM data comparator mask x register (ETM_DCMRx)

Address offset: $0x100 + 0x4 * (x - 1)$, (x = 1 to 3)

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
MASK[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MASK[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **MASK[31:0]**: Data mask

When a data mask bit is set to 1, the corresponding bit in the ETM_DCVRn register is disregarded in the comparison and must be set to zero

ETM counter reload value x register (ETM_CNTRLDVRx)

Address offset: $0x140 + 0x4 * (x - 1)$, (x = 1 to 2)

Reset value: 0x0000 0000

Bits 31:17 Reserved, must be kept at reset value.

Bits 16:14 **FCN[2:0]**: Boolean function

If A is defined as the first resource match and B as the second match, an event is defined as a function of A and B.

0x0: A
 0x1: NOT A
 0x2: A AND B
 0x3: NOT A AND B
 0x4: NOT A AND NOT B
 0x5: A OR B
 0x6: NOT A OR B
 0x7: NOT A OR NOT B

Bits 13:7 **RESOURCEB[6:0]**: Second resource identifier

See RESOURCEA[6:0] field for bit description.

Bits 6:0 **RESOURCEA[6:0]**: First resource identifier

Bits [6:4] defines the resource type and bits [3:0] the index. The supported resource identifiers are listed below. Programming any other values may result in unpredictable behavior.

0x00: Single address comparator 1
 ...
 0x0F: Single address comparator 16
 0x10: Address range comparator 1
 ...
 0x17: Address range comparator 8
 0x18: Instrumentation resource 1
 0x19: Instrumentation resource 2
 0x1A: Instrumentation resource 3
 0x1B: Instrumentation resource 4
 0x20: Embedded-ICE watchpoint comparators 1 (from DWT)
 ...
 0x27: Embedded-ICE watchpoint comparators 8 (from DWT)
 0x40: Counter 1 at zero
 0x41: Counter 2 at zero
 0x42: Counter 3 at zero
 0x43: Counter 4 at zero
 0x50: Sequencer in states 1
 0x51: Sequencer in states 2
 0x52: Sequencer in states 3
 0x58: Context ID comparator 1
 0x5B: VMID comparator
 0x5F: Trace start/stop resource
 0x60: External inputs 1
 0x61: External inputs 2
 0x62: External inputs 3
 0x63: External inputs 4
 0x6D: Processor is in non-secure state
 0x6E: Trace prohibited by processor
 0x6F: Hard-wired input, always true
 Others: Reserved

- Bits 31:30 Reserved, must be kept at reset value.
- Bit 29 **TSSIZE**: Timestamp size
1: 64 bits.
- Bit 28 **TSENC**: Timestamp encoding
1: Timestamp is encoded as a natural binary number
- Bit 27 **CNTFNC**: Counter function
0: Counter is a full function counter
- Bit 26 **VIRTEXT**: Virtual extensions
1: Virtual extensions supported

- Bits 25:23 Reserved, must be kept at reset value.
- Bit 22 **TIMSTMP**: Timestamping
1: Timestamping supported
- Bit 21 **ETMEIBCR**: EmbeddedICE behavior control implemented
0: Not implemented
- Bit 20 **TSSUWP**: Trace start/stop uses Embedded ICE watchpoint inputs
0: No embeddedICE watchpoint inputs supported
- Bits 19:16 **EMBICEWPS[3:0]**: Embedded ICE watchpoint inputs
0: No embeddedICE watchpoint inputs supported
- Bits 15:13 **INSTRES[2:0]**: Instrumentation resources
0: None
- Bit 12 **DACOMPS**: Data address comparison support
0: No data address comparisons are supported
- Bit 11 **ARR**: Readable registers
1: All registers are readable
- Bits 10:3 **PMUEVENTREGS[7:0]**: Number of PMU event registers available
0x1E: 30 registers
- Bits 2:0 **EEISELS[2:0]**: Number of extended external input selectors
0x2: 2 selectors

ETM extended external input selection register (ETM_EXTINSELR)

FCN[1:0]		RESOURCEB[6:0]						RESOURCEA[6:0]							
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:17 Reserved, must be kept at reset value.

Bits 16:14 **FCN[2:0]**: Boolean function

If A is defined as the first resource match and B as the second match, an event is defined as a function of A and B.

- 0x0: A
- 0x1: NOT A
- 0x2: A AND B
- 0x3: NOT A AND B
- 0x4: NOT A AND NOT B
- 0x5: A OR B
- 0x6: NOT A OR B
- 0x7: NOT A OR NOT B

Bits 13:7 **RESOURCEB[6:0]**: Second resource identifier
See RESOURCEA[6:0] field for bit description.

Bits 6:0 **RESOURCEA[6:0]**: First resource identifier

Bits [6:4] defines the resource type and bits [3:0] the index. The supported resource identifiers are listed below. Programming any other values may result in unpredictable behavior.

- 0x00: Single address comparator 1
- ...
- 0x0F: Single address comparator 16
- 0x10: Address range comparator 1
- ...
- 0x17: Address range comparator 8
- 0x18: Instrumentation resource 1
- 0x19: Instrumentation resource 2
- 0x1A: Instrumentation resource 3
- 0x1B: Instrumentation resource 4
- 0x20: Embedded-ICE watchpoint comparators 1 (from DWT)
- ...
- 0x27: Embedded-ICE watchpoint comparators 8 (from DWT)
- 0x40: Counter 1 at zero
- 0x41: Counter 2 at zero
- 0x42: Counter 3 at zero
- 0x43: Counter 4 at zero
- 0x50: Sequencer in states 1
- 0x51: Sequencer in states 2
- 0x52: Sequencer in states 3
- 0x58: Context ID comparator 1
- 0x5B: VMID comparator
- 0x5F: Trace start/stop resource
- 0x60: External inputs 1
- 0x61: External inputs 2
- 0x62: External inputs 3
- 0x63: External inputs 4
- 0x6D: Processor is in non-secure state
- 0x6E: Trace prohibited by processor
- 0x6F: Hard-wired input, always true
- Others: Reserved

ETM auxiliary control register (ETM_AUXCR)

Address offset: 0x1FC

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DPKTT RCDIS	TSPKT GENS UP	DNFOV FL
													r	r	r

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **DPKTTRCDIS**: Disable tracing of data packets

- 0: Not disabled
- 1: Disabled

Bit 1 **TSPKTGENSUP**: Suppress generation of timestamp packets

- 0: Do not suppress
- 1: Suppress generation of timestamp packets as the result of executing an ISB instruction

Bit 0 **DNFOVFL**: Do not force FIFO overflow

- 0: Force FIFO overflow if a periodic synchronisation has not been output for two full synchronisation periods
- 1: Do not force FIFO overflow

ETM trace ID register (ETM_TRACEIDR)

Address offset: 0x200

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TRACEID[7:0]							
								rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **TRACEID[7:0]**: Trace ID to output onto the trace bus

This should be programmed with a unique value to differentiate it from other trace sources in the system.

ETM ID 2 register (ETM_IDR2)

Address offset: 0x208

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SWP TO	RFE TO
														r	r

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **SWPTO**: SWP or SWPB instruction order
 Identifies the order for a SWP or SWPB instruction.
 0: The Load transfer is traced before the Store transfer

Bit 0 **RFETO**: RFE instruction order
 Identifies the order for a RFE instruction.
 0: The PC transfer is traced before the CPSR transfer

ETM VMID comparator value register (ETM_VMIDCVR)

Address offset: 0x240

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16		
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	VMID[7:0]									
								rw	rw	rw	rw	rw	rw	rw	rw		

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **VMID[7:0]**: Virtual machine ID for comparison with current one

ETM OS lock access register (ETM_OSLAR)

Address offset: 0x300

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
KEYVALUE[31:16]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
KEYVALUE[15:0]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w

Bits 31:0 **KEYVALUE[31:0]**: ETM register lock access
 0xC5ACCE55: Disable access
 Other values: Enable access

ETM OS lock status register (ETM_OSLSR)

Address offset: 0x304

Reset value: 0x0000 000A

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ETM OSLAR	NTT	DBGR LKED	DBGR LKSUP
												r	r	r	r

Bits 31:4 Reserved, must be kept at reset value.

Bit 3 **ETMOSLAR**: ETM OS lock access register implemented
 1: Implemented

Bit 2 **NTT**: 32-bit access required
 0: 32-bit accesses are required to operate the ETM_OSLAR

Bit 1 **DBGRLKED**: Registers locked
 0: ETM registers are not locked
 1: ETM registers are locked. Any access will return a slave-generated error response

Bit 0 **DBGRLKSUP**: ETM power down support
 0: Full support

ETM OS save & restore register (ETM_OSSRR)

Address offset: 0x308

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
VALUE[31:16]															
r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
VALUE[15:0]															
r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w

Bits 31:0 **VALUE[31:0]**: OS save/restore register value

On first read after locking the registers, this register contains the number of additional accesses required to save or restore the ETM registers.
 Subsequent reads during an OS save return the contents of each register for storing in memory. During an OS restore, subsequent writes load the written value to each register in turn.

ETM device power-down control register (ETM_PDCR)

Address offset: 0x310

Reset value: 0x0000 0008

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TRCP WREN	Res.	Res.	Res.
												rw			

Bits 31:4 Reserved, must be kept at reset value.

Bit 3 **TRCPWREN**: Trace power enable

1: Power to the domain containing the trace registers must be provided.

Bits 2:0 Reserved, must be kept at reset value.

ETM device power-down status register (ETM_PDSR)

Address offset: 0x314

Reset value: 0x0000 0023

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	OSLOC KST	Res.	Res.	Res.	STKYR EGST	ETMP WRD
										r				r	r

Bits 31:6 Reserved, must be kept at reset value.

Bit 5 **OSLOCKST**: OS lock status

The value of this bit is the same as the value of bit[1] of the ETM_OSLSR.

Bits 4:2 Reserved, must be kept at reset value.

Bit 1 **STKYREGST**: Sticky register state

0: Indicates this register has been read after a reset

1: Indicates this register has never been read after a reset

Bit 0 **ETMPWRD**: ETM powered

1: ETM powered; trace registers can be accessed.

ETM claim tag set register (ETM_CLAIMSET)

Address offset: 0xFA0

Reset value: 0x0000 00FF

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CLAIMSET[7:0]							
								rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **CLAIMSET[7:0]**: Set claim tag bits

Write:

00000000: No effect

xxxxxx1: Set bit 0

xxxxxx1x: Set bit 1

xxxxx1xx: Set bit 2

...etc.

Read:

0xFF: Indicates there are eight bits in claim tag

ETM claim tag clear register (ETM_CLAIMCLR)

Address offset: 0xFA4

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CLAIMCLR[7:0]							
								rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **CLAIMCLR[7:0]**: Reset claim tag bits

Write:

00000000: No effect

xxxxxx1: Clear bit 0

xxxxxx1x: Clear bit 1

xxxxx1xx: Clear bit 2

xxxx1xxx: Clear bit 3

...etc.

Read: Returns current value of claim tag

ETM lock access register (ETM_LAR)

Address offset: 0xFB0

Reset value: 0xFFFF XXXX

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
ACCESS_W[31:16]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ACCESS_W[15:0]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w

Bits 31:0 **ACCESS_W[31:0]**: ETM register write access
 Enables write access to some ETM registers by processor cores (debuggers do not need to unlock the component)
 0xC5ACCE55: Enable write access
 Other values: Disable write access

ETM lock status register (ETM_LSR)

Address offset: 0xFB4
 Reset value: 0x0000 0003

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	LOCK TYPE	LOCK GRANT	LOCK EXIST
													r	r	r

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **LOCKTYPE**: Size of the ETM_LAR register
 0: 32-bit

Bit 1 **LOCKGRANT**: Current status of lock
 This bit always returns zero when read by an external debugger.
 0: Write access is permitted
 1: Write access is blocked. Only read access is permitted.

Bit 0 **LOCKEXIST**: Existence of lock control mechanism
 The bit indicates whether a lock control mechanism exists. It always returns zero when read by an external debugger.
 0: No lock control mechanism exists
 1: Lock control mechanism is implemented

ETM authentication status register (ETM_AUTHSTAT)

Address offset: 0xFB8
 Reset value: 0x0000 000A

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SNID[1:0]		SID[1:0]		NSNID[1:0]		NSID[1:0]	
								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:6 **SNID[1:0]**: Security level for secure non-invasive debug

- 0x: Unused
- 10: Secure non-invasive debug disabled
- 11: Secure non-invasive debug enabled

Bits 5:4 **SID[1:0]**: Security level for secure invasive debug

- 00: Not implemented

Bits 3:2 **NSNID[1:0]**: Security level for non-secure non-invasive debug

- 0x: Unused
- 10: Non-secure non-invasive debug disabled
- 11: Non-secure non-invasive debug enabled

Bits 1:0 **NSID[1:0]**: Security level for non-secure invasive debug

- 00: Not implemented

ETM Coresight device configuration register (ETM_DEVID)

Address offset: 0xFC8

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
DEVICEID[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DEVICEID[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **DEVICEID[31:0]**: Device configuration

- 0x0: No configuration information

ETM CoreSight device type register (ETM_DEVTYPE)

Address offset: 0xFCC

Reset value: 0x0000 0013

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SUBTYPE[3:0]			MAJORTYPE[3:0]				
								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **SUBTYPE[3:0]**: Device sub-type identifier
 0x1: Processor trace

Bits 3:0 **MAJORTYPE[3:0]**: Device main type identifier
 0x3: Trace source

ETM CoreSight peripheral identity register 4 (ETM_PIDR4)

Address offset: 0xFD0

Reset value: 0x0000 0004

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

66.11.4 Cross trigger interface (CTI)

See [Section 66.10.3](#).

66.12 Cortex[®]-M4 debug features

The Cortex[®]-M4 subsystem integrates the following CoreSight[™] components:

- CM4 ROM table
- CM4 System Control Space (SCS)
- Breakpoint Unit (FPB)
- Data Watchpoint and Trace Unit (DWT)
- Instrumentation Trace Macrocell (ITM)
- Embedded Trace Macrocell (ETM)
- Cross Trigger Interface (CTI)

These components are accessible by the debugger via the Cortex[®]-M4 AHB-AP.

66.12.1 ROM tables

The ROM table is a CoreSight[™] component that contains the base addresses of all the CoreSight[™] debug components accessible via the AHB-AP. These tables allow a debugger to discover the topology of the CoreSight[™] system automatically.

There is one ROM table in the Cortex[®]-M4 subsystem. This table is pointed to by the BASE register in the Cortex[®]-M4 AHB-AP. It contains the base address pointer for the System Control Space registers, which allow the debugger to identify the CPU core, as well as for the FPB, DWT, ITM, ETM and CTI.

The Cortex[®]-M4 CPU ROM table described in [Table 603](#) occupies a 4-Kbyte, 32-bit wide chunk of address space, from 0xE00F F000 to 0xE00F FFFC.

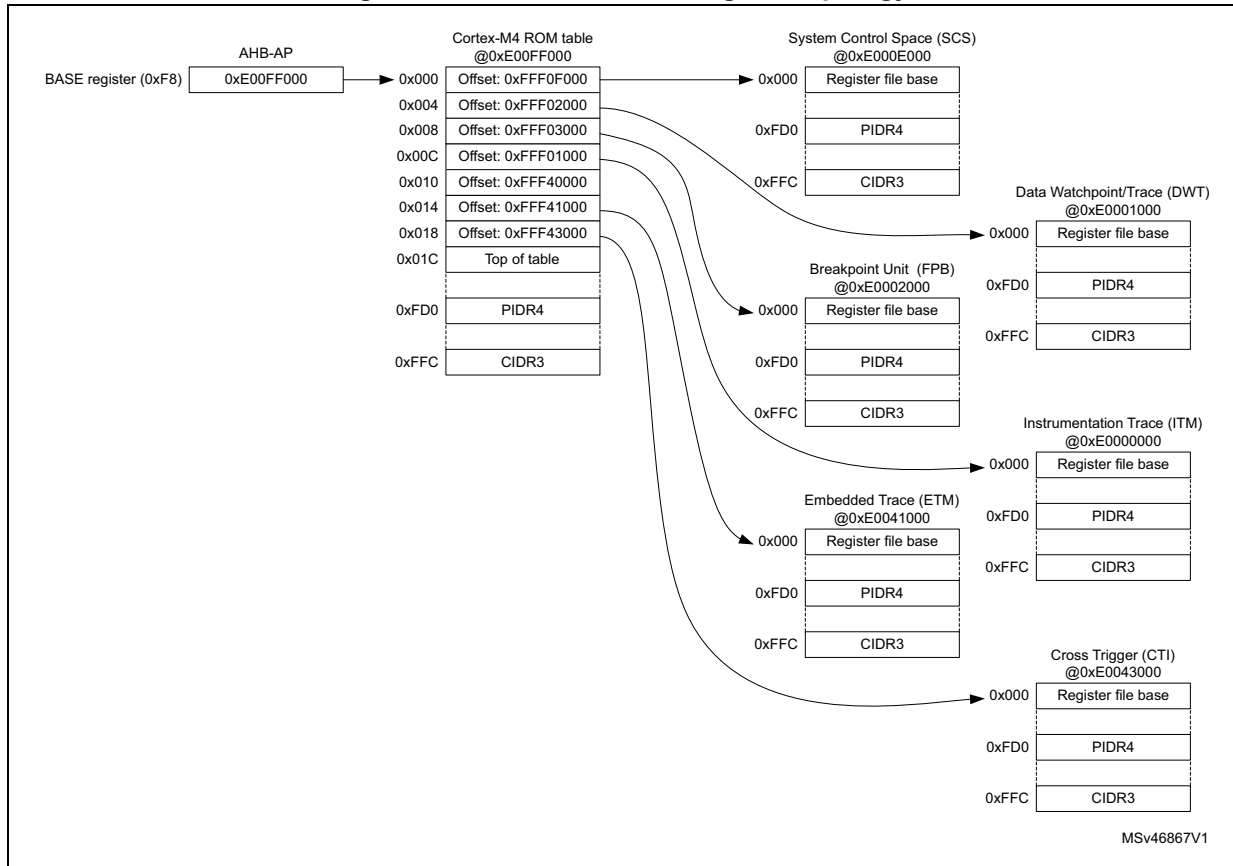

Table 603. Cortex[®]-M4 CPU ROM table

Address in ROM table	Component name	Component base address	Component address offset	Size	Entry
0xE00F F000	SCS	0xE000 E000	0xFFF0 F000	4 Kbyte	0xFFF0 F003
0xE00F F004	DWT	0xE000 1000	0xFFF0 2000	4 Kbyte	0xFFF0 2003
0xE00F F008	FPB	0xE000 2000	0xFFF0 3000	4 Kbyte	0xFFF0 3003
0xE00F F00C	ITM	0xE000 0000	0xFFF0 1000	4 Kbyte	0xFFF01 003
0xE00F F010	TPIU ⁽¹⁾	0xE004 0000	0xFFF4 1000	4 Kbyte	0xFFF4 1002
0xE00F F014	ETM	0xE004 1000	0xFFF4 2000	4 Kbyte	0xFFF4 2003
0xE00F E018	CTI	0xE004 3000	0xFFF4 5000	4 Kbyte	0xFFF4 5003
0xE00F F01C	Top of table	-	-	-	0x0000 0000
0xE00F F020 to 0xE00F FFC8	Reserved	-	-	-	0x0000 0000
0xE00F FFCC to 0xE00F FFFC	ROM table registers	-	-	-	See Table 604

1. The TPIU is included in this table by default, but bit 0 is reset to indicate that it is not present.

The topology for the CoreSight™ components in the Cortex®-M4 subsystem is shown in Figure 830.

Figure 830. Cortex®-M4 CoreSight™ topology

Cortex®-M4 ROM registers

CM4ROM memory type register (CM4ROM_MEMTYPE)

Address offset: 0xFFC

Reset value: 0x0000 0001

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SYSTEM
															r

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **SYSTEM**: system memory

0x1: system memory is present on this bus

CM4ROM CoreSight peripheral identity register 4 (CM4ROM_PIDR4)

Address offset: 0xFD0

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SIZE[3:0]				JEP106CON[3:0]			
								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **SIZE[3:0]**: register file size

0x0: register file occupies a single 4-Kbyte region

Bits 3:0 **JEP106CON[3:0]**: JEP106 continuation code

0x0: No continuation code

CM4ROM CoreSight peripheral identity register 0 (CM4ROM_PIDR0)

Address offset: 0xFE0

Reset value: 0x0000 0050

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	PARTNUM[7:0]							
								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **PARTNUM[7:0]**: part number bits [7:0]

0x50: ROM table part number bits [7:0]

CM4ROM CoreSight peripheral identity register 1 (CM4ROM_PIDR1)

Address offset: 0xFE4

Reset value: 0x0000 0004

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	JEP106ID[3:0]				PARTNUM[11:8]			
								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **JEP106ID[3:0]**: JEP106 identity code bits [3:0]
 0x0: STMicroelectronics identity code bits [3:0]

Bits 3:0 **PARTNUM[11:8]**: part number bits [11:8]
 0x4: ROM table part number bits [11:8]

CM4ROM CoreSight peripheral identity register 2 (CM4ROM_PIDR2)

Address offset: 0xFE8

Reset value: 0x0000 000A

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	REVISION[3:0]			JEDEC	JEP106ID[6:4]			
								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **REVISION[3:0]**: component revision number
 0x0: r0p0

Bit 3 **JEDEC**: JEDEC assigned value
 0x1: designer ID specified by JEDEC

Bits 2:0 **JEP106ID[6:4]**: JEP106 identity code bits [6:4]
 0x2: STMicroelectronics identity code bits [6:4]

CM4ROM CoreSight peripheral identity register 3 (CM4ROM_PIDR3)

Address offset: 0xFEC

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	REVAND[3:0]			CMOD[3:0]				
								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **REVAND[3:0]**: metal fix version
 0x0: No metal fix

Bits 3:0 **CMOD[3:0]**: customer modified
 0x0: No customer modifications

CM4ROM CoreSight component identity register 0 (CM4ROM_CIDR0)

Address offset: 0xFF0

Reset value: 0x0000 000D

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	PREAMBLE[7:0]							
								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **PREAMBLE[7:0]**: component ID bits [7:0]
 0x0D: common ID value

CM4ROM CoreSight peripheral identity register 1 (CM4ROM_CIDR1)

Address offset: 0xFF4

Reset value: 0x0000 0010

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CLASS[3:0]				PREAMBLE[11:8]			
								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **CLASS[3:0]**: component ID bits [15:12] - component class
 0x1: ROM table component

Bits 3:0 **PREAMBLE[11:8]**: component ID bits [11:8]
 0x0: common ID value

CM4ROM CoreSight component identity register 2 (CM4ROM_CIDR2)

Address offset: 0xFF8

Reset value: 0x0000 0005

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	PREAMBLE[19:12]							
								r	r	r	r	r	r	r	r

It also contains counters for:

- Clock cycles
- Folded instructions
- Load Store Unit (LSU) operations
- Sleep cycles
- Number of cycles per instruction
- Interrupt overhead

A DWT comparator compares one of the following with the value held in its DWT_COMP register:

- a) a data address
- b) an instruction address
- c) a data value
- d) the cycle count value, for comparator 0 only.

For address matching, the comparator can use a mask, so it matches a range of addresses.

On a successful match, the comparator generates one of the following:

- One or more DWT Data trace packets, containing one or more of:
 - a) the address of the instruction that caused a data access
 - b) an address offset, bits[15:0] of the data access address
 - c) the matched data value
- A watchpoint debug event, on either the PC value or the accessed data address
- A CMPMATCH[N] event, that signals the match outside the DWT unit

A watchpoint debug event either generates a Debug Monitor exception, or causes the processor to halt execution and enter Debug state.

For more details on how to use the DWT, refer to the *Arm®v7-M Architecture Reference Manual* [5].

Data watchpoint and trace unit registers

The Cortex®-M4 DWT registers are located at address range 0xE0001000 to 0xE0001FFC.

DWT control register (DWT_CTRL)

Address offset: 0x000

Reset value: 0x4000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
NUMCOMP[3:0]				NOTRCPKT	NOEXTRIG	NOCYCNT	NOPRFCNT	Res.	CYCEVTENA	FOLDEVTENA	LSUEVTENA	SLEEPEVTENA	EXCEVTENA	CPIEVTENA	EXCTRCENA
r	r	r	r	r	r	r	r		r/w	r/w	r/w	r/w	r/w	r/w	r/w

			r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w

Bits 31:28 **NUMCOMP[3:0]**: number of comparators implemented

0x4: four comparators

Bit 27 **NOTRCPKT**: trace sampling and exception tracing support

0x0: supported

Bit 26 **NOEXTRIG**: external match signal, CMPMATCH support

0x0: supported

Bit 25 **NOCYCNT**: cycle counter support

0x0: supported

Bit 24 **NOPRFCNT**: profiling counter support

0x0: supported

Bit 23 Reserved, must be kept at reset value.

Bit 22 **CYCEVTENA**: enable for POSTCNT underflow event counter packet generation

0x0: disabled

0x1: enabled

Bit 21 **FOLDEVTENA**: enable for folded instruction counter overflow event generation

0x0: disabled

0x1: enabled

Bit 20 **LSUEVTENA**: enable for LSU counter overflow event generation

0x0: disabled

0x1: enabled

Bit 19 **SLEEPEVTENA**: enable for Sleep mode counter overflow event generation

0x0: disabled

0x1: enabled

Bit 18 **EXCEVTENA**: enable for exception overhead counter overflow event generation

0x0: disabled

0x1: enabled

Bit 17 **CPIEVTENA**: enable for CPI counter overflow event generation

0x0: disabled

0x1: enabled

Bit 16 **EXCTRCENA**: enable for exception trace generation
 0x0: disabled
 0x1: enabled

Bits 15:13 Reserved, must be kept at reset value.

Bit 12 **PCSAMPLENA**: PC sample enable
 Enables the use of the POSTCNT counter as a timer for periodic PC sample packet generation.
 0x0: disabled
 0x1: enabled

Bits 11:10 **SYNCTAP[1:0]**: synchronization tap position
 Selects the position of the synchronization packet counter tap on the CYCCNT counter. This determines the synchronization packet rate.
 0x0: disabled. No synchronization packets
 0x1: tap at CYCCNT[24]
 0x2: tap at CYCCNT[26]
 0x3: tap at CYCCNT[28]

Bit 9 **CYCTAP**: CYCCNT tap position
 Selects the position of the POSTCNT tap on the CYCCNT counter.
 0x0: tap at CYCCNT[6]
 0x1: tap at CYCCNT[10]

Bits 8:5 **POSTINIT[3:0]**: POSTCNT counter initial value
 Writes to this field are ignored if POSTCNT counter is enabled (meaning that CYCEVTENA or PCSAMPLENA must be reset prior to writing POSTINIT).

Bits 4:1 **POSTPRESET[3:0]**: POSTCNT counter reload value

Bit 0 **CYCCNTENA**: CYCCNT counter enable
 0x0: disabled
 0x1: enabled

DWT cycle count register (DWT_CYCCNT)

Address offset: 0x004

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CPICNT[7:0]							
								rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **CPICNT[7:0]**: CPI counter

Counts additional cycles required to execute multi-cycle instructions, except those recorded by DWT_LSUCNT, and counts any instruction fetch stalls.

DWT exception count register (DWT_EXCCNT)

Address offset: 0x00C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	EXCCNT[7:0]							
								rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **EXCCNT[7:0]**: exception overhead cycle counter

Counts the number of cycles spent in exception processing.

DWT Sleep mode count register (DWT_SLPCNT)

Address offset: 0x010

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SLEPCNT[7:0]							
								rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **SLEPCNT[7:0]**: sleep mode cycle counter

Counts the number of cycles spent in Sleep mode (WFI, WFE, sleep-on-exit).

DWT LSU count register (DWT_LSUCNT)

Address offset: 0x014

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	LSUCNT[7:0]							
								rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **LSUCNT[7:0]**: load store counter

Counts the additional cycles required to execute load and store instructions.

DWT fold count register (DWT_FOLDCNT)

Address offset: 0x018

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	FOLDCNT[7:0]							
								rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **FOLDCNT[7:0]**: folded instruction counter

Increments on each instruction that takes 0 cycles.

DWT program counter sample register (DWT_PCSR)

Address offset: 0x01C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
EIASAMPLE[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
EIASAMPLE[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **EIASAMPLE[31:0]**: executed instruction address sample value

Samples the current value of the program counter.

DWT comparator x registers (DWT_COMPx)

Address offset: 0x020 + 0x010 * x, (x = 0 to 3)

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
COMP[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
COMP[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **COMP[31:0]**: reference value for comparison

DWT comparator mask x registers (DWT_MASKx)

Address offset: 0x024 + 0x010 * x, (x = 0 to 3)

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	MASK[4:0]				
											r/w	r/w	r/w	r/w	r/w

Bits 31:5 Reserved, must be kept at reset value.

Bits 4:0 **MASK[4:0]**: comparator mask size

Provides the size of the ignore mask applied to the access address for address range matching by comparator x. A debugger can write 11111 to this field and then read the register back to determine the maximum mask size supported.

DWT comparator function x registers (DWT_FUNCtx)

Address offset: 0x028 + 0x010 * x, (x = 0 to 3)

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	MATCHED	Res.	Res.	Res.	Res.	DATAVADDR1[3:0]			
							r					r/w	r/w	r/w	r/w
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DATAVADDR0[3:0]				DATAVSIZE[1:0]		LNKTENA	DATAMATCH	CYCMATCH	Res.	EMITRANGE	Res.	FUNCTION[3:0]			
r/w	r/w	r/w	r/w	r/w	r/w	r	r/w	r/w		r/w		r/w	r/w	r/w	r/w

Bits 31:25 Reserved, must be kept at reset value.

Bit 24 **MATCHED**: comparator match

Indicates if a comparator match has occurred since the register was last read.

0: no match

1: match occurred

Bits 23:20 Reserved, must be kept at reset value.

Bits 19:16 **DATAVADDR1[3:0]**: second comparator number

When the DATAVMATCH and LNK1ENA bits are both 1, this field can hold the comparator number of a second comparator to use for linked address comparison.

Bits 15:12 **DATAVADDR0[3:0]**: comparator number

When the DATAVMATCH and LNK1ENA bits are both 1, this field can hold the comparator number of a comparator to use for linked address comparison.

Bits 11:10 **DATAVSIZE[1:0]**: data comparison size

For data value matching, specifies the size of the required data comparison.

0x0: byte

0x1: half word

0x2: word

0x3: reserved

Bit 9 **LNK1ENA**: second linked comparator support

Indicates whether use of a second linked comparator is supported.

0x1: supported

Bit 8 **DATAVMATCH**: cycle comparison enable

0x0: performs address comparison

0x1: performs data value comparison

Bit 7 **CYCMATCH**: cycle count comparison enable

Enables cycle count comparison on comparator 0. This field is reserved for other comparators.

0x0: no cycle count comparison

0x1: compares DWT_COMP0 with the cycle counter, DWT_CYCCNT

Bit 6 Reserved, must be kept at reset value.

Bit 5 **EMITRANGE**: address offset data trace enable

Enables generation of data trace address offset packets (containing data address bits 0 to 15).

0x0: disabled

0x1: enabled

Bit 4 Reserved, must be kept at reset value.

Bits 3:0 **FUNCTION[3:0]**: comparator match action

Selects the action to take on comparator match. The meaning of this bit field depends on the setting of the DATAVMATCH and CYCMATCH fields. See [\[5\]](#).

DWT CoreSight peripheral identity register 4 (DWT_PIDR4)

Address offset: 0xFD0

Reset value: 0x0000 0004

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SIZE[3:0]				JEP106CON[3:0]			
								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **SIZE[3:0]**: register file size

0x0: register file occupies a single 4-Kbyte region

Bits 3:0 **JEP106CON[3:0]**: JEP106 continuation code

0x4: Arm® JEDEC code

DWT CoreSight peripheral identity register 0 (DWT_PIDR0)

Address offset: 0xFE0

Reset value: 0x0000 0002

66.12.3 Instrumentation trace macrocell (ITM)

The ITM generates trace information as packets. There are four sources that can generate packets. If multiple sources generate packets at the same time, the ITM arbitrates the order in which packets are output. The four sources in decreasing order of priority are:

- Software trace.

Software can write directly to any of 32 x 32-bit ITM stimulus registers to generate packets. The permission level for each port can be programmed. When software writes to an enabled stimulus port, the ITM combines the identity of the port, the size of the write access, and the data written, into a packet that it writes to a FIFO. The ITM outputs packets from the FIFO onto the trace bus. Reading a stimulus port register returns the status of the stimulus register (empty or pending) in bit 0.
- Hardware trace.

The DWT generates trace packets in response to a data trace event, a PC sample or a performance profiling counter wraparound. The ITM outputs these packets on the trace bus.
- Local timestamping.

The ITM contains a 21-bit counter clocked by the (pre-divided) processor clock. The counter value is output in a timestamp packet on the trace bus. The counter is reset to zero every time a timestamp packet is generated. The timestamps thus indicate the time elapsed since the previous timestamp packet.
- Global system timestamping.

Timestamps can also be generated using the system-wide 64-bit count value coming from the Timestamp Generator component.

Instrumentation trace macrocell registers

The ITM registers are located at address range 0xE0000000 to 0xE000FFC.

ITM stimulus x registers (ITM_STIMx)

Address offset: 0x000 + 0x004 *x,(x = 0 to 31)

Reset value: 0xFFFF XXXX

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
STIMULUS[31:16]															
rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
STIMULUS[15:0]															
rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW

Bits 31:0 **STIMULUS[31:0]**: stimulus port indicator
 Write data is output on the trace bus as a software event packet. When reading, bit 0 is a FIFOREADY indicator.
 0: stimulus port buffer is full (or port is disabled)
 1: stimulus port can accept new write data

ITM trace enable register (ITM_TER)

Address offset: 0x080
 Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
STIMENA[31:16]															
rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
STIMENA[15:0]															
rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW

Bits 31:0 **STIMENA[31:0]**: stimulus port enable
 Each bit x (0:32) enables the stimulus port associated with the ITM_STIMx register.
 0: port disabled
 1: port enabled

ITM trace privilege register (ITM_TPR)

Address offset: 0xE00
 Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
PRIVMASK[31:16]															
rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
PRIVMASK[15:0]															
rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW

Bits 31:0 **PRIVMASK[31:0]**: unprivileged access enable

Enables unprivileged access to ITM stimulus ports. Each bit controls eight stimulus ports.

XXX0: unprivileged access permitted on ports 0 to 7

XXX1: only privileged access permitted on ports 0 to 7

XX0X: unprivileged access permitted on ports 8 to 15

XX1X: only privileged access permitted on ports 8 to 15

X0XX: unprivileged access permitted on ports 16 to 23

X1XX: only privileged access permitted on ports 16 to 23

0XXX: unprivileged access permitted on ports 24 to 31

1XXX: only privileged access permitted on ports 24 to 31

ITM trace control register (ITM_TCR)

Address offset: 0xE80

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	BUSY	TRACEBUSID[6:0]						
								r	r/w	r/w	r/w	r/w	r/w	r/w	r/w
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	GTSFREQ[1:0]		TSPRESCALE[1:0]		Res.	Res.	Res.	SWOENA	TXENA	SYNCENA	TSENA	ITMENA
				r/w	r/w	r/w	r/w				r	r/w	r/w	r/w	r/w

Bits 31:24 Reserved, must be kept at reset value.

Bit 23 **BUSY**: ITM busy

Indicates whether the ITM is currently processing events.

0: not busy

1: busy

Bits 22:16 **TRACEBUSID[6:0]**: identifier for multi-source trace stream formatting

If multi-source trace is in use, the debugger must write a non-zero value to this field.

Different IDs must be used for each trace source in the system.

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:10 **GTSFREQ[1:0]**: global timestamp frequency

Defines how often the ITM generates a global timestamp, based on the global timestamp clock frequency, or disables generation of global timestamps.

The possible values are:

0x0: disable generation of global timestamps

0x1: generate timestamp request whenever the ITM detects a change in global timestamp counter bits [47:7]. This is approximately every 128 cycles.

0x2: generate timestamp request whenever the ITM detects a change in global timestamp counter bits [47:13]. This is approximately every 8192 cycles.

0x3: generate a timestamp after every packet, if the output FIFO is empty.

Bits 9:8 **TSPRESCALE[1:0]**: local timestamp prescaler

This field is used with the trace packet reference clock.

The possible values are:

0x0: no prescaling

0x1: divide by 4

0x2: divide by 16

0x3: divide by 64

Bits 7:5 Reserved, must be kept at reset value.

Bit 4 **SWOENA**: Enables asynchronous clocking of the timestamp counter

0: timestamp counter uses processor clock

Bit 3 **TXENA**: Enables forwarding of hardware event packets from the DWT unit to the trace port

0: disabled

1: enabled

Bit 2 **SYNCENA**: synchronisation packet transmission enable

If a debugger sets this bit it must also configure the DWT_CTRL register SYNCTAP field in the DWT for the correct synchronisation speed.

0: disabled

1: enabled

Bit 1 **TSENA**: local timestamp generation enable

0: disabled

1: enabled

Bit 0 **ITMENA**: ITM enable

0: disabled

1: enabled

ITM CoreSight peripheral identity register 4 (ITM_PIDR4)

Address offset: 0xFD0

Reset value: 0x0000 0004

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

FPB remap register (FPB_REMAP)

Address offset: 0x004

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	RMPSP	REMAP[23:11]												
		r	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
REMAP[10:0]											Res.	Res.	Res.	Res.	Res.
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw					

Bits 31:30 Reserved, must be kept at reset value.

Bit 29 **RMPSP**: flash patch remap support
 Indicates whether flash patch remap is supported.
 0x1: remapping supported.

Bits 28:5 **REMAP**[23:0]: remap target address
 Bits [28:5] of the base address in SRAM to which the FPB remaps the address. The remap base address must be aligned to the number of words required to support the implemented comparators, that is to (NUM_CODE + NUM_LIT) words, with a minimum alignment of 8 words. Because remap is into the SRAM memory region, 0x2000 0000-0x3FFF FFFF, bits [31:29] of the remap address are 001.

Bits 4:0 Reserved, must be kept at reset value.

FPB comparator x registers (FPB_COMPx)

Address offset: 0x008 + 0x004 * x, (x = 0 to 7)

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
REPLACE[1:0]		Res.	COMP[26:14]												
rw	rw		rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
COMP[13:0]														Res.	ENABLE
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw		rw

Bits 31:30 **REPLACE[1:0]**: behavior at comparison match

Defines the behavior when a match occurs between the COMP field and the instruction fetch/literal address⁽¹⁾.

0x0: remap to address defined in FPB_REMAP register, plus 4n, where n is the comparator number.

0x1: breakpoint on lower half-word, upper half-word is unaffected

0x2: breakpoint on upper half-word, lower half-word is unaffected

0x3: breakpoint on both upper and lower half-words

Bit 29 Reserved, must be kept at reset value.

Bits 28:2 **COMP[26:0]**: value to compare with address bits 28:2 of accesses to instruction code memory (0x0000 0000 to 0x1FFF FFFF). If a match occurs, the action to be taken is defined by the REPLACE field.

Bit 1 Reserved, must be kept at reset value.

Bit 0 **ENABLE**: comparator enable

The comparator is only enabled if both this bit and the FPB ENABLE bit in the FPB_CTRL register are set.

0: disabled

1: enabled

1. FPB_COMP(0:5) correspond to the instruction address comparators. FPB_COMP(6:7) correspond to the literal address comparators.

FPB CoreSight peripheral identity register 4 (FPB_PIDR4)

Address offset: 0xFD0

Reset value: 0x0000 0004

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SIZE[3:0]				JEP106CON[3:0]			
								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **SIZE[3:0]**: register file size

0x0: register file occupies a single 4-Kbyte region

Bits 3:0 **JEP106CON[3:0]**: JEP106 continuation code

0x4: Arm® JEDEC code

FPB CoreSight peripheral identity register 0 (FPB_PIDR0)

Address offset: 0xFE0

Reset value: 0x0000 0003

								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **REVISION[3:0]**: component revision number
 0x0: r0p4

Bit 3 **JEDEC**: JEDEC assigned value
 0x1: designer ID specified by JEDEC

Bits 2:0 **JEP106ID[6:4]**: JEP106 identity code bits [6:4]
 0x3: Arm® JEDEC code

FPB CoreSight peripheral identity register 3 (FPB_PIDR3)

Address offset: 0xFEC

Reset value: 0x0000 0000

66.12.5 Embedded trace macrocell (ETM)

The Cortex®-M4 ETM is a CoreSight™ component closely coupled to the CPU. The ETM generates trace packets that allow the execution of the Cortex®-M4 core to be traced. In STM32MP157, the ETM is configured for instruction trace only, meaning that data accesses are not included in the trace information.

The ETM receives information from the CPU over the processor trace interface, including:

- The number of instructions executed in the same cycle
- Changes in program flow
- The current processor instruction state
- The addresses of memory locations accessed by load and store instructions
- The type, direction and size of a transfer
- Condition code information
- Exception information
- Wait for interrupt state information

For more information, refer to the *Arm® CoreSight™ ETM™-Cortex®-M4 technical reference manual [7]*.

Embedded trace macrocell registers

The ETM registers are accessed by the debugger via the Cortex®-M4 AHB-AP, at address range 0xE004 1000 to 0xE004 1FFC.

Cortex-M4 ETM registers

ETM control register (M4_ETM_CR)

Address offset: 0x000

Reset value: 0x0000 0411

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	TSEN	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
				rw											
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	ETMEN	PROG	DBRQ	BO	STALL	Res.	Res.	Res.	Res.	Res.	Res.	PDN
				rw	rw	rw	rw	rw							rw

Bits 31:28 Reserved, must be kept at reset value.

Bit 27 **TSEN**: Timestamp enable
 0: Timestamping disabled
 1: Timestamping enabled

Bits 26:12 Reserved, must be kept at reset value.

Bit 11 **ETMEN**: ETM enable
 0: Trace output disabled
 1: Trace output enabled

Bit 10 **PROG**: ETM programming
 This bit must be set to 1 before programming the ETM. Tracing is prevented while this bit is set to 1.
 0: ETM operational
 1: ETM in programming state

Bit 9 **DBRQ**: Debug request.
 When set to 1 and the trigger event occurs, the ETMDBGRQ output is asserted until HALTED is observed. This enables the Arm® processor to be forced into Debug state.

Bit 8 **BO**: Branch output
 When set to 1 all branch addresses are output, even if the branch was because of a direct branch instruction. Setting this bit enables reconstruction of the program flow without having access to the memory image of the code being executed.
 When this bit is set to 1, more trace data is generated, and this may affect the performance of the trace system. Information about the execution of a branch is traced regardless of the state of this bit.

Bit 7 **STALL**: Stall processor
 The FIFOFULL output can be used to stall the processor to prevent overflow. The FIFOFULL output is only enabled when the stall processor bit is set to 1. When the bit is 0 the FIFOFULL output remains low at all times and the FIFO overflows if there are too many trace packets. Trace resumes without corruption once the FIFO has drained, if overflow does occur.

Bits 6:1 Reserved, must be kept at reset value.

Bit 0 **PDN**: ETM power down
 This bit can be used by an implementation to control if the ETM is in a low power state. This bit must be cleared by the trace software tools at the beginning of a debug session.
 When this bit is set to 1, writes to some registers and fields might be ignored. The following registers and fields are still write-accessible:

- ETMCR bit [0]
- ETMLAR
- ETMCLAIMSET register
- ETMCLAIMCLR register

When the ETMCR is written with this bit set to 1, bits other than bit [0] might be ignored.

ETM configuration code register (M4_ETM_CCR)

Address offset: 0x004

Reset value: 0x8C80 2000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
IDPRES	Res.	Res.	Res.	CPMAC	TSPRES	CIDCMP[1:0]		FFPRES	NEXTO[2:0]			NEXTI[2:0]			SEQPRES

r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bit 31 **IDPRES**: ETM ID register present

1: ETMIDR register is present and defines the ETM architecture version in use

Bits 30:28 Reserved, must be kept at reset value.

Bit 27 **CPMAC**: Co-processor and memory access

1: Memory-mapped access to registers is supported

Bit 26 **TSPRES**: Trace start/stop block present

1: Trace start/stop block is present

Bits 25:24 **CIDCMP[1:0]**: Number of context ID comparators

0x0: Context ID comparators are not implemented.

Bit 23 **FFPRES**: FIFOFULL logic present

To use FIFOFULL the system must also support the function, as indicated by bit[8] of ETMSCR.

1: FIFOFULL logic is present in the ETM

Bits 22:20 **NEXTO[2:0]**: Number of external outputs

0x0: No external outputs are supported

Bits 19:17 **NEXTI[2:0]**: Number of external inputs

0x2: Two external inputs are supported

Bit 16 **SEQPRES**: Sequencer present

0: The sequencer is not present in the ETM.

Bits 15:13 **NCNT[2:0]**: Number of counters

0x1: One counter is implemented

Bits 12:8 **NMMDEC[4:0]**: Number of memory map decoders

0x0: No memory map decoder inputs are implemented.

Bits 7:4 **NDVCMP[3:0]**: Number of data value comparators

0x0: No data value comparators are implemented.

Bits 3:0 **NADCMP[3:0]**: Number of address comparator pairs

0x0: No address comparator pairs are implemented.

ETM trigger register (M4_ETM_TRIGGER)

Address offset: 0x008

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

FCN[1:0]		RESOURCEB[6:0]						RESOURCEA[6:0]							
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:17 Reserved, must be kept at reset value.

Bits 16:14 **FCN[2:0]**: Boolean function

If A is defined as the first resource match and B as the second match, an event is defined as a function of A and B.

- 0x0: A
- 0x1: NOT A
- 0x2: A AND B
- 0x3: NOT A AND B
- 0x4: NOT A AND NOT B
- 0x5: A OR B
- 0x6: NOT A OR B
- 0x7: NOT A OR NOT B

Bits 13:7 **RESOURCEB[6:0]**: Second resource identifier
See RESOURCEA[6:0] field for bit description.

Bits 6:0 **RESOURCEA[6:0]**: First resource identifier

Bits [6:4] defines the resource type and bits [3:0] the index. The supported resource identifiers are listed below. Programming any other values may result in unpredictable behavior.

- 0x20: Embedded-ICE watchpoint comparators 1 (from DWT)
- 0x21: Embedded-ICE watchpoint comparators 2 (from DWT)
- 0x22: Embedded-ICE watchpoint comparators 3 (from DWT)
- 0x23: Embedded-ICE watchpoint comparators 4 (from DWT)
- 0x40: Counter 1 at zero
- 0x5F: Trace start/stop resource
- 0x60: External inputs 1
- 0x61: External inputs 2
- 0x6F: Hard-wired input, always true
- Others: Reserved

ETM status register (M4_ETM_SR)

Address offset: 0x010

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TRIGFL	TSSRSTAT	PROGVAL	UOVFL
												rw	rw	r	r

Bits 31:4 Reserved, must be kept at reset value.

Bit 3 **TRIGFL**: Trigger flag

Set when the trigger occurs, and prevents the trigger from being output until the ETM is programmed again.

Bit 2 **TSSRSTAT**: Trigger start/stop resource status

Holds the current status of the trace start/stop resource. If set to 1, it indicates that a trace on address has been matched, without a corresponding trace off address match.

Bit 1 **PROGVAL**: Programming bit value (read-only)

The current effective value of the ETM Programming bit, bit [10] of the M4_ETM_CR. Set the programming bit to 1 and wait for this bit to go to 1 before programming the ETM. This bit remains at 0 until the FIFO is empty, or if OS lock is set in the M4_ETM_OSLSR register.

Bit 0 **UOVFL**: Untraced overflow (read-only)

If set to 1, there is an overflow that has not yet been traced. This bit is cleared to 0 when trace is restarted, or when the ETM power-down bit (bit [0] of the M4_ETM_CR register) is set to 1.

ETM configuration register (M4_ETM_SCR)

Address offset: 0x014

Reset value: 0x0002 0D09

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

	r	r	r	r	r	r	r						r	r	r

Bits 31:18 Reserved, must be kept at reset value.

Bit 17 **NOFTCHCOMP**: No fetch comparisons

1: Fetch comparisons are not implemented

Bits 16:15 Reserved, must be kept at reset value.

Bits 14:12 **NSUPPROC[2:0]**: Number of supported processors

0x0: One processor supported

Bit 11 **PORTMODESUP**: Port mode support
 0: Current selected port mode is not supported
 1: Current selected port mode is supported

Bit 10 **PORTSIZESUP**: Port size support
 0: Current selected port size is not supported
 1: Current selected port size is supported

Bit 8 **FFSUP**: FIFOFULL support
 1: FIFOFULL is supported

Bits 7:3 Reserved, must be kept at reset value.

Bits 9, 2, 1, 0 **MAXPORTSIZE[3:0]**: Maximum ETM port size field
 These bits indicate the maximum ETM port size supported.
 0x1: Maximum port size = 1

ETM trace enable event register (M4_ETM_TEEVR)

Address offset: 0x020

Reset value: 0x0000 0000

FCN[1:0]		RESOURCEB[6:0]						RESOURCEA[6:0]							
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:17 Reserved, must be kept at reset value.

Bits 16:14 **FCN[2:0]**: Boolean function
 If A is defined as the first resource match and B as the second match, an event is defined as a function of A and B.

- 0x0: A
- 0x1: NOT A
- 0x2: A AND B
- 0x3: NOT A AND B
- 0x4: NOT A AND NOT B
- 0x5: A OR B
- 0x6: NOT A OR B
- 0x7: NOT A OR NOT B

Bits 13:7 **RESOURCEB[6:0]**: Second resource identifier
 See RESOURCEA[6:0] field for bit description.

Bits 6:0 **RESOURCEA[6:0]**: First resource identifier

Bits [6:4] defines the resource type and bits [3:0] the index. The supported resource identifiers are listed below. Programming any other values may result in unpredictable behavior.

0x20: Embedded-ICE watchpoint comparators 1 (from DWT)

0x21: Embedded-ICE watchpoint comparators 2 (from DWT)

0x22: Embedded-ICE watchpoint comparators 3 (from DWT)

0x23: Embedded-ICE watchpoint comparators 4 (from DWT)

0x40: Counter 1 at zero

0x5F: Trace start/stop resource

0x60: External inputs 1

0x61: External inputs 2

0x6F: Hard-wired input, always true

Others: Reserved

ETM trace enable control 1 register (M4_ETM_TECR1)

Address offset: 0x024

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	ENON OFF	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Bits 31:26 Reserved, must be kept at reset value.

Bit 25 **ENONOFF**: Trace start/stop trace enable control

0: Trace start/stop block does not control trace enable

1: Trace enable is controlled by the trace start/stop block

Bits 24:0 Reserved, must be kept at reset value.

ETM FIFOFULL level register (M4_ETM_FFLR)

Address offset: 0x028

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	LEVEL[7:0]							
								rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **LEVEL[7:0]**: Threshold for FIFOFULL signal

The number of bytes left in the FIFO, below which the FIFOFULL signal is asserted. For example, setting this value to 15 causes processor stalling, if enabled, when there are less than 15 free bytes in the FIFO.

ETM counter reload value 1 register (M4_ETM_CNTRLDVR1)

Address offset: 0x140

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **INICNT[15:0]**: Initial count

Specifies the counter reload value.

ETM synchronization frequency register (M4_ETM_SYNCFR)

Address offset: 0x1E0

Reset value: 0x0000 0400

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.				FREQUENCY[11:0]											
				r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:12 Reserved, must be kept at reset value.

Bits 11:0 **FREQUENCY[11:0]**: Distance of synchronization points

This value is the time in bytes between synchronization points in the trace, used by ETM (the tools can start decompressing only at synchronization points).

0x400: fixed synchronization packet generation every 1024 bytes of trace

ETM ID register (M4_ETM_IDR)

Address offset: 0x1E4

Reset value: 0x4114 F250

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:24 **DESIGNER[7:0]**: Implementer code
0x41: Arm®

Bits 23:21 Reserved, must be kept at reset value.

Bit 20 **ABPE**: Alternative ranch packet encoding
1: ABPE is implemented.

Bit 19 **SXSUPP**: Security extensions support
0: ETM behaves as if the processor is in secure mode at all times

Bit 18 **T32SUPP**: 32-bit Thumb instruction tracing
1: 32-bit Thumb instructions are traced as single instructions

Bit 17 Reserved, must be kept at reset value.

Bit 16 **LDPCF**: Load PC first
0: Data tracing is not supported

Bits 15:12 **PROCFAM[3:0]**: Processor family
0xF: Processor family is not identified in this register

Bits 11:8 **ETMARCHMAJ[3:0]**: Major ETM architecture version
0x2: Version 3

Bits 7:4 **ETMARCHMIN[3:0]**: Minor ETM architecture version
0x5: Version 5

Bits 3:0 **REVISION[3:0]**: Implementation revision
0x0: Revision 0

ETM configuration code extension register (M4_ETM_CCER)

Address offset: 0x1E8

Reset value: 0x1854 1800

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

- Bits 31:30 Reserved, must be kept at reset value.
- Bit 29 **TSSIZE**: Timestamp size
0: 48 bits.
- Bit 28 **TSENC**: Timestamp encoding
1: Timestamp is encoded as a natural binary number
- Bit 27 **RFC**: Reduced function counter
1: Counter is a reduced function counter
- Bits 26:23 Reserved, must be kept at reset value.
- Bit 22 **TSIMP**: Timestamping implemented
1: Timestamping implemented
- Bit 21 **EIIMP**: EmbeddedICE behavior control implemented
0: Not implemented
- Bit 20 **TSSUWP**: Trace start/stop uses Embedded ICE watchpoint inputs
1: Yes
- Bits 19:16 **NUMWPIN[3:0]**: Embedded ICE watchpoint inputs
Number of inputs coming from the DWT.

0x4: Four inputs
- Bits 15:13 **NUMIR[2:0]**: Instrumentation resources
0x0: None
- Bit 12 **SUPPDAC**: Data address comparison support
1: Not supported
- Bit 11 **RR**: Readable registers
1: All registers are readable
- Bits 10:3 **XXINBUS[7:0]**: Extended external input bus
0x0: Not implemented
- Bits 2:0 **XXINSEL[2:0]**: Extended external input selectors
0x0: Not implemented

ETM trace enable start/stop embedded ICE control register (M4_ETM_TESSEICR)

Address offset: 0x1F0

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	STOPRS[3:0]

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	STARTRS[3:0]			
												rw	rw	rw	rw

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:16 **STOPRS[3:0]**: Stop resource selection

Setting any of these bits to 1 selects the corresponding EmbeddedICE watchpoint input as a TraceEnable stop resource. Bit [16] corresponds to input 1, bit [17] corresponds to input 2, bit [18] corresponds to input 3, and bit [19] corresponds to input 4.

Bits 15:4 Reserved, must be kept at reset value.

Bits 3:0 **STARTRS[3:0]**: Start resource selection

Setting any of these bits to 1 selects the corresponding EmbeddedICE watchpoint input as a TraceEnable start resource. Bit [0] corresponds to input 1, bit [1] corresponds to input 2, bit [2] corresponds to input 3, and bit [3] corresponds to input 4.

ETM timestamp event register (M4_ETM_TSEVR)

Address offset: 0x1F8

Reset value: 0x0000 0000

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:17 Reserved, must be kept at reset value.

Bits 16:14 **FCN[2:0]**: Boolean function

If A is defined as the first resource match and B as the second match, an event is defined as a function of A and B.

- 0x0: A
- 0x1: NOT A
- 0x2: A AND B
- 0x3: NOT A AND B
- 0x4: NOT A AND NOT B
- 0x5: A OR B
- 0x6: NOT A OR B
- 0x7: NOT A OR NOT B

Bits 13:7 **RESOURCEB[6:0]**: Second resource identifier
 See RESOURCEA[6:0] field for bit description.

Bits 6:0 **RESOURCEA[6:0]**: First resource identifier

Bits [6:4] defines the resource type and bits [3:0] the index. The supported resource identifiers are listed below. Programming any other values may result in unpredictable behavior.

- 0x20: Embedded-ICE watchpoint comparators 1 (from DWT)
- 0x21: Embedded-ICE watchpoint comparators 2 (from DWT)
- 0x22: Embedded-ICE watchpoint comparators 3 (from DWT)
- 0x23: Embedded-ICE watchpoint comparators 4 (from DWT)
- 0x40: Counter 1 at zero
- 0x5F: Trace start/stop resource
- 0x60: External inputs 1
- 0x61: External inputs 2
- 0x6F: Hard-wired input, always true
- Others: Reserved

ETM trace ID register (M4_ETM_TRACEIDR)

Address offset: 0x200

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TRACEID[6:0]						
									r/w	r/w	r/w	r/w	r/w	r/w	r/w

Bits 31:7 Reserved, must be kept at reset value.

Bits 6:0 **TRACEID[6:0]**: Trace ID to output onto the trace bus

This should be programmed with a unique value to differentiate it from other trace sources in the system.

ETM ID register 2 (M4_ETM_IDR2)

Address offset: 0x208

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SWP TO	RFE TO
														r	r

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **SWPTO**: SWP or SWPB instruction order

Identifies the order for a SWP or SWPB instruction.

0: The Load transfer is traced before the Store transfer

Bit 0 **RFETO**: RFE instruction order

Identifies the order for a RFE instruction.

0: The PC transfer is traced before the CPSR transfer

ETM device power-down status register 2 (M4_ETM_PDSR)

Address offset: 0x314

Reset value: 0x0000 0001

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CLAIMSET[3:0]			
												rw	rw	rw	rw

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **CLAIMSET[3:0]**: Set claim tag bits

- Write:
- 0000: No effect
 - xxx1: Set bit 0
 - xx1x: Set bit 1
 - x1xx: Set bit 2
 - 1xxx: Set bit 3

Read:
0xF: Indicates there are four bits in claim tag

ETM claim tag clear register (M4_ETM_CLAIMCLR)

Address offset: 0xFA4
Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CLAIMCLR[3:0]			
												rw	rw	rw	rw

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **CLAIMCLR[3:0]**: Reset claim tag bits

- Write:
- 0000: No effect
 - xxx1: Clear bit 0
 - xx1x: Clear bit 1
 - x1xx: Clear bit 2
 - 1xxx: Clear bit 3

Read: Returns current value of claim tag

ETM lock access register (M4_ETM_LAR)

Address offset: 0xFB0
Reset value: 0xFFFF XXXX

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
ACCESS_W[31:16]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ACCESS_W[15:0]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w

Bits 31:0 **ACCESS_W[31:0]**: ETM register write access

Enables write access to some ETM registers by processor cores (debuggers do not need to unlock the component)

0xC5ACCE55: Enable write access

Other values: Disable write access

ETM lock status register (M4_ETM_LSR)

Address offset: 0xFB4

Reset value: 0x0000 0003

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	LOCK TYPE	LOCK GRANT	LOCK EXIST
													r	r	r

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **LOCKTYPE**: Size of the ETM_LAR register

0: 32-bit

Bit 1 **LOCKGRANT**: Current status of lock

This bit always returns zero when read by an external debugger.

0: Write access is permitted

1: Write access is blocked. Only read access is permitted.

Bit 0 **LOCKEXIST**: Existence of lock control mechanism

The bit indicates whether a lock control mechanism exists. It always returns zero when read by an external debugger.

0: No lock control mechanism exists

1: Lock control mechanism is implemented

ETM authentication status register (M4_ETM_AUTHSTAT)

Address offset: 0xFB8

Reset value: 0x0000 000A

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SUBTYPE[3:0]				MAJORTYPE[3:0]			
								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **SUBTYPE[3:0]**: Device sub-type identifier
 0x1: Processor trace

Bits 3:0 **MAJORTYPE[3:0]**: Device main type identifier
 0x3: Trace source

ETM CoreSight peripheral identity register 4 (M4_ETM_PIDR4)

Address offset: 0xFD0

Reset value: 0x0000 0004

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SIZE[3:0]				JEP106CON[3:0]			
								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **SIZE[3:0]**: Register file size

0x0: Register file occupies a single 4 Kbyte region

Bits 3:0 **JEP106CON[3:0]**: JEP106 continuation code

0x4: Arm® JEDEC code

ETM CoreSight peripheral identity register 0 (M4_ETM_PIDR0)

Address offset: 0xFE0

Reset value: 0x0000 0025

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

67 Device electronic signature

The device electronic signature are either set in HW and stored in the OTP (visible in BSEC registers) which can be read using the debug interface or by the CPU. It contains factory-programmed identification data that allow the user firmware or other external devices to automatically match the characteristics of the component.

67.1 Unique device ID register (96 bits) (UID)

The unique device identifier is ideally suited:

- for use as serial number (USB string serial number, or other end applications)
- for use as part of the security keys, to increase the security of code in Flash memory while using and combining this unique ID with software cryptographic primitives and protocols before programming the memory
- during processes such as secure boot.

The 96-bit unique device identifier provides a reference number, unique for a given device and in any context. These bits cannot be altered by the user.

Base address: 0x5C00 5000 (BSEC base address on APB5)

Address offset: 0x234

Reset value: 0xXXXX XXXX

Note: X is factory-programmed.

Bits 31:0 **UID[31:0]**: 31:0 unique ID bits

Address offset: 0x238

Reset value: 0xXXXX XXXX

Note: X is factory-programmed.

Bits 31:0 **UID[63:32]**: 63:32 unique ID bits

Address offset: 0x23C

Reset value: 0xXXXX XXXX

Note: X is factory-programmed.

68 Important security notice

The STMicroelectronics group of companies (ST) places a high value on product security, which is why the ST product(s) identified in this documentation may be certified by various security certification bodies and/or may implement our own security measures as set forth herein. However, no level of security certification and/or built-in security measures can guarantee that ST products are resistant to all forms of attacks. As such, it is the responsibility of each of ST's customers to determine if the level of security provided in an ST product meets the customer needs both in relation to the ST product alone, as well as when combined with other components and/or software for the customer end product or application. In particular, take note that:

- ST products may have been certified by one or more security certification bodies, such as Platform Security Architecture (www.psacertified.org) and/or Security Evaluation standard for IoT Platforms (www.trustcb.com). For details concerning whether the ST product(s) referenced herein have received security certification along with the level and current status of such certification, either visit the relevant certification standards website or go to the relevant product page on www.st.com for the most up to date information. As the status and/or level of security certification for an ST product can change from time to time, customers should re-check security certification status/level as needed. If an ST product is not shown to be certified under a particular security standard, customers should not assume it is certified.
- Certification bodies have the right to evaluate, grant and revoke security certification in relation to ST products. These certification bodies are therefore independently responsible for granting or revoking security certification for an ST product, and ST does not take any responsibility for mistakes, evaluations, assessments, testing, or other activity carried out by the certification body with respect to any ST product.
- Industry-based cryptographic algorithms (such as AES, DES, or MD5) and other open standard technologies which may be used in conjunction with an ST product are based on standards which were not developed by ST. ST does not take responsibility for any flaws in such cryptographic algorithms or open technologies or for any methods which have been or may be developed to bypass, decrypt or crack such algorithms or technologies.
- While robust security testing may be done, no level of certification can absolutely guarantee protections against all attacks, including, for example, against advanced attacks which have not been tested for, against new or unidentified forms of attack, or against any form of attack when using an ST product outside of its specification or intended use, or in conjunction with other components or software which are used by customer to create their end product or application. ST is not responsible for resistance against such attacks. As such, regardless of the incorporated security features and/or any information or support that may be provided by ST, each customer is solely responsible for determining if the level of attacks tested for meets their needs, both in relation to the ST product alone and when incorporated into a customer end product or application.
- All security features of ST products (inclusive of any hardware, software, documentation, and the like), including but not limited to any enhanced security features added by ST, are provided on an "AS IS" BASIS. AS SUCH, TO THE EXTENT PERMITTED BY APPLICABLE LAW, ST DISCLAIMS ALL WARRANTIES, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO THE IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE, unless the applicable written and signed contract terms specifically provide otherwise.

69 Revision history

Table 609. Document revision history

Date	Revision	Changes
09-Feb-2019	1	Initial release.
21-Feb-2019	2	Updated Section 3: Boot and security and OTP control (BSEC) .
24-Jul-2019	3	<p>Updated Section 2.1.2: Memory Map organization. Updated Section 2.2.3: Master ports description. Updated Section 3.3.3: OTP security modes. Updated Section 3.3.9: Debug control. Updated Table 22: DDRPHYC I/O list. Updated Section 8.5.1: Signal set 0: to monitor the DDR utilization. Updated Section 8.6.9: DDRPERFM event counter x register (DDRPERFM_CNTx). Updated Figure 27: Power control block diagram. Updated Table 29: PWR pin overview. Updated Section 9.3.8: PWR VSW domain. Updated Figure 80: Peripheral clock distribution for QUADSPI and FMC. Updated Section 10.7.82: RCC stop request set register (RCC_MP_SREQSETR). Updated Section 10.7.83: RCC stop request clear register (RCC_MP_SREQCLRR). Updated Section 10.7.84: RCC global control register (RCC_MP_GCR). Updated Section 10.7.93: RCC PWR_LP delay control register (RCC_PWRLPDLYCR). Updated Section 10.7.116: RCC global reset control set register (RCC_MP_GRSTCSETR). Updated Section 10.7.134: RCC APB5 peripheral enable for MPU set register (RCC_MP_APB5ENSETR). Updated Section 10.7.136: RCC APB5 peripheral enable for MPU clear register (RCC_MP_APB5ENCLRR). Updated Section 10.7.137: RCC AHB5 peripheral enable for MCU set register (RCC_MC_AHB5ENSETR). Updated Section 10.7.139: RCC AHB5 peripheral enable for MCU clear register (RCC_MC_AHB5ENCLRR). Updated Section 10.7.186: RCC AHB5 peripheral enable for MCU set register (RCC_MC_AHB5LPENSETR). Updated Section 10.7.219: RCC IWDG clock freeze set register (RCC_MP_IWDGFZSETR). Updated Section 10.7.220: RCC IWDG clock freeze clear register (RCC_MP_IWDGFZCLRR).</p>

Table 609. Document revision history (continued)

Date	Revision	Changes
18-Feb-2020	4 (continued)	<p>Updated Section 33.8: DFSDM filter x module registers (x=0..5) introduction.</p> <p>DCMI: Updated Section 34.3: DCMI functional description. Updated Table 229: DCMI input/output pins. Updated Figure 273: DCMI signal waveforms. Updated Figure 277: Coordinates and size of the window after cropping.</p> <p>RNG: Updated Section 37.3.3: Random number generation. Updated Figure 323: Entropy source model. Updated Figure 324: RNG initialization overview. Updated Section 37.3.5: RNG operation.</p> <p>CRYP: Updated Section 39.2: CRYP main features. Updated Section 39.4.5: CRYP procedure to perform a cipher operation. Updated Section 39.4.17: CRYP key registers. Updated Table 285: CRYP interrupt requests. Updated Table 286: Processing latency for ECB, CBC and CTR. Updated Table 287: Processing time (in clock cycle) for GCM and CCM per 128-bit block.</p> <p>TIM1/TIM8: Updated Section 40.3.29: Debug mode.</p> <p>TIM12/TIM13/TIM14: Updated Section 42.4.8: TIM12 capture/compare mode register 1 [alternate] (TIM12_CCMR1). Updated Section 42.4.15: TIM12 timer input selection register (TIM12_TISEL). Updated Section 42.5.6: TIMx capture/compare mode register 1 [alternate] (TIMx_CCMR1)(x = 13 to 14).</p> <p>TIM15/TIM16/TIM17: Updated Section 43.5.8: TIM15 capture/compare mode register 1 [alternate] (TIM15_CCMR1). Updated Section 43.5.20: TIM15 input selection register (TIM15_TISEL). Updated Section 43.6.7: TIMx capture/compare mode register 1 [alternate] (TIMx_CCMR1) (x = 16 to 17).</p> <p>LPTIM: Updated Section 45.4.5: Glitch filter.</p> <p>IWDG: Updated Section 48.4.3: Software and hardware watchdog modes. Updated Section 48.7.4: IWDG status register (IWDG_SR).</p>

Table 609. Document revision history (continued)

Date	Revision	Changes
18-Feb-2020	4 (continued)	<p>SPI: Updated Section 54.4.5: Standard multi-slave communication. Updated Figure 626: Waveform examples. Updated Figure 627: Master I2S Philips protocol waveforms (16/32-bit full accuracy). Updated Figure 628: I2S Philips standard waveforms. Updated Figure 629: Master MSB Justified 16-bit or 32-bit full-accuracy length. Updated Figure 630: Master MSB justified 16 or 24-bit data length. Updated Figure 631: Slave MSB justified. Updated Figure 632: LSB justified 16 or 24-bit data length. Updated Figure 636: Start-up sequence, I2S Philips standard, master. Updated Figure 638: Stop sequence, I2S Philips standard, master. Updated Section 54.11.1: SPI/I2S control register 1 (SPI_CR1).</p> <p>SAI: Updated Figure 654: Start-up sequence.</p> <p>SPDIF: Updated Section 56.2: SPDIFRX main features. Updated Section 56.5.1: SPDIFRX control register (SPDIFRX_CR) introduction.</p> <p>SDMMC: Added Section 58.1: SDMMC main features.</p> <p>FDCAN: Added Section 59.3: FDCAN implementation. Updated Section : Rx handling. Updated Section : Operating conditions. Updated Section 59.4.6: Application. Updated Section 59.5.31: FDCAN Rx FIFO 1 status register (FDCAN_RXF1S). Updated Section 59.7.2: Calibration configuration register (FDCAN_CCU_CCFG).</p> <p>CEC: Updated Section 63.7.6: CEC interrupt enable register (CEC_IER).</p> <p>ETH: Added Table 492: Ethernet peripheral pins. Updated Table 493: Ethernet internal input/output signals. Updated Figure 780: Ethernet high-level block diagram. Updated Section : PTP timestamp offload function. Updated Section : Channel i status register (ETH_DMACEISR).</p>

Table 609. Document revision history (continued)

Date	Revision	Changes
18-Feb-2020	4 (continued)	<p>Updated Section : Tx queue 0 quantum weight register (ETH_MTLTXQ0QWR).</p> <p>Updated Section : Tx queue 1 quantum weight register (ETH_MTLTXQ1QWR).</p> <p>Updated Section : Extended operating mode configuration register (ETH_MACECR).</p> <p>Updated Section : Rx queue control 0 register (ETH_MACRXQC0R).</p> <p>Updated Section : HW feature 1 register (ETH_MACHWF1R).</p> <p>Updated Section : ARP address register (ETH_MACARPAR).</p> <p>Updated Section : L3 and L4 control 0 register (ETH_MACL3L4C0R).</p> <p>Updated Section : L3 and L4 control 1 register (ETH_MACL3L4C1R).</p> <p>Updated Section : Subsecond increment register (ETH_MACSSIR).</p> <p>DBG:</p> <p>Updated Section : FPB CoreSight component identity register 0 (FPB_CIDR0).</p> <p>Device electronic signature:</p> <p>Updated Section 67.2: Device part number (RPN).</p> <p>Updated Section 67.4: Package data register (PKG).</p>
15-Jan-2021	5	<p>BSEC:</p> <p>Updated Section 3.3.2: Interface to OTP.</p> <p>Updated Section 3.3.6: OTP operations.</p> <p>Updated footnote in Table 14: Write access permissions.</p> <p>Updated footnote in Table 15: Read access permissions.</p> <p>Updated Section 3.6.5: BSEC OTP lock configuration register (BSEC_OTP_LOCK).</p> <p>Updated Section 3.6.16: BSEC shadow register x (BSEC_OTP_DATAx).</p> <p>OTP:</p> <p>Updated Table 17: OTP list words 0 to 31.</p> <p>DDRCTRL:</p> <p>Updated Figure 7: DDRCTRL block diagram.</p> <p>Updated Section 5.6: DDRCTRL configuration introduction.</p> <p>Updated Section 5.7.3: DDRCTRL mode register read/write control register 0 (DDRCTRL_MRCTRL0).</p> <p>Updated Section 5.7.78: DDRCTRL port x read Q0S configuration register 1 (DDRCTRL_PCFGQOS1_x).</p>

Table 609. Document revision history (continued)

Date	Revision	Changes
15-Jan-2021	5 (continued)	<p>DDRPHY: Updated Figure 12: DDRPHYC block diagram. Updated Section 7.7.1: DDRPHYC revision ID register (DDRPHYC_RIDR). Updated Section 7.7.3: DDRPHYC PHY global control register (DDRPHYC_PGCR). Updated Section 7.7.5: DDRPHYC DDR DLL global control register (DDRPHYC_DLLGCR). Updated Section 7.7.10: DDRPHYC ACIOC register (DDRPHYC_ACIOCR). Updated Section 7.7.14: DDRPHYC DTP register 0 (DDRPHYC_DTPR0). Updated Section 7.7.15: DDRPHYC DTP register 1 (DDRPHYC_DTPR1). Updated Section 7.7.16: DDRPHYC DTP register 2 (DDRPHYC_DTPR2). Updated Section 7.7.25: DDRPHYC ODTIC register (DDRPHYC_ODTICR). Updated Section 7.7.35: DDRPHYC byte lane n GC register (DDRPHYC_DXnGCR).</p> <p>PWR: Updated Section 9.3.8: PWR VSW domain. Updated Figure 36: Power-on reset/power-down reset waveform. Updated Figure 37: BOR thresholds. Added footnote to Figure 34: Functionalities depending on system operating mode. Updated Section 9.6.9: PWR LP-Stop and LPLV-Stop modes.</p> <p>RCC: Updated Section : Clock distribution for TIMs and LPTIMs. Moved Section : Glitch skipper (GSKP). Updated Section 10.7.25: RCC APB1 clock divider register (RCC_APB1DIVR). Updated Section 10.7.26: RCC APB2 clock divider register (RCC_APB2DIVR). Updated Section 10.7.27: RCC APB3 clock divider register (RCC_APB3DIVR). Updated Section 10.7.67: RCC FDCAN kernel clock selection register (RCC_FDCANCKSELR).</p> <p>HSEM: Updated entire Section 11: Hardware semaphore (HSEM).</p> <p>IPCC: Added Table 79: IPCC interface signals. Updated Section 12.3.4: IPCC interrupts. Updated Section 12.4.4: IPCC processor 1 to processor 2 status register (IPCC_C1TOC2SR).</p>

Table 609. Document revision history (continued)

Date	Revision	Changes
15-Jan-2021	5 (continued)	<p>Updated Section 12.4.8: IPCC processor 2 to processor 1 status register (IPCC_C2TOC1SR).</p> <p>Updated Section 12.4.9: IPCC hardware configuration register (IPCC_HWCFGR).</p> <p>GPIO:</p> <p>Updated Section 13.3.2: I/O pin alternate function multiplexer and mapping.</p> <p>ETZPC:</p> <p>Updated Section 15.7: ETZPC registers introduction.</p> <p>Block interconnect:</p> <p>Updated Section 16.1.1: Introduction.</p> <p>MDMA:</p> <p>Updated Section 17.5.6: MDMA channel x control register (MDMA_CxCR).</p> <p>DMA:</p> <p>Updated Figure 130: DMA block diagram</p> <p>DMAMUX:</p> <p>Updated Table 111: DMAMUX: assignment of multiplexer inputs to resources.</p> <p>Updated Section 19.4.4: DMAMUX request line multiplexer.</p> <p>Interrupt list:</p> <p>Added note to Table 119: STM32MP157 EXTI Events.</p> <p>GIC:</p> <p>Updated Section 23.5.21: GICD shared peripheral interrupt register x (GICD_SPISRx).</p> <p>EXTI:</p> <p>Updated Section 24: Extended interrupt and event controller (EXTI) introduction.</p> <p>Updated Section 24.2.1: EXTI connections between peripherals and CPU.</p> <p>Updated Section 24.3: EXTI functional description.</p> <p>Updated footnote of Table 127: Masking functionality.</p> <p>Updated Section 24.6.23: EXTI CPU wakeup with interrupt mask register (EXTI_C1IMR1) title.</p> <p>Suppressed Section 24.6.xx: EXTI CPU wakeup with event mask register (EXTI_C1EMR1) title.</p> <p>Updated Section 24.6.26: EXTI CPU wakeup with interrupt mask register (EXTI_C1IMR2) title.</p> <p>Suppressed Section 24.6.xx: EXTI CPU wakeup with event mask register (EXTI_C1EMR2) title.</p> <p>Updated Section 24.6.29: EXTI CPU wakeup with interrupt mask register (EXTI_C1IMR3) title and reset value.</p> <p>Suppressed Section 24.6.xx: EXTI CPU wakeup with event mask register (EXTI_C1EMR3) title.</p> <p>Updated Section 24.6.32: EXTI hardware configuration register x (EXTI_HWCFGRx) reset value.</p>

Table 609. Document revision history (continued)

Date	Revision	Changes
15-Jan-2021	5 (continued)	<p>FMC: Updated Section 26.1: FMC main features. Added note in Section 26.7.2: NAND flash memory address mapping. Updated Section 26.8.4: NOR flash/PSRAM controller asynchronous transactions. Updated Table 158: FMC_BCRx bitfields (mode D). Updated Table 161: FMC_BCRx bitfields (Muxed mode). Updated Section 26.8.6: NOR/PSRAM controller registers. Added Section : FMC size identification register (FMC_SIDR). Added Section : FMC identification register (FMC_IPIDR). Added Section : FMC version register (FMC_VERR). Added Section : FMC hardware configuration register 1 (FMC_HWCFCGR1). Added Section : FMC hardware configuration register 2 (FMC_HWCFCGR2). Updated Section 26.9.5: NAND flash prewait function. Updated Figure 166: Access to NAND flash memory. Updated Section : BCH (Bose, Chaudhuri and Hocquenghem) code. Updated Section 26.9.7: FMC command sequencer. Updated Figure 168: Example of 2 Kbyte page program sequence with 4-bit BCH. Updated Section : Page read sequence. Updated Figure 169: Chained-page read command timings. Updated Figure 169: Chained-page read command timings.</p> <p>DLYB: Updated Section 28.2: DLYB main features. Updated Section 28.3: DLYB functional description.</p> <p>DTS: Updated Section 30.6.2: Temperature sensor T0 value register 1 (DTS_TOVALR1).</p> <p>DAC: Updated Section : Sample and hold mode. Updated formula in Section 31.4.12: DAC channel buffer calibration.</p> <p>VREFBUF: Updated Section 32.3.1: VREFBUF control and status register (VREFBUF_CSR). Updated Section 32.3.2: VREFBUF calibration control register (VREFBUF_CCR).</p> <p>LTDC: deeply revisited section.</p>

Table 609. Document revision history (continued)

Date	Revision	Changes
15-Jan-2021	5 (continued)	<p>DSI: Added Section 36.4.2: DSI Host pins and internal signals. Updated Section : Synchronization with the LTDC. Updated Section 36.16.8: DSI Wrapper regulator and PLL control register (DSI_WRPCR).</p> <p>HASH: updated Section 38.4.5: Message digest computing. updated Section 38.4.7: HMAC operation. updated Section 38.7.1: HASH control register (HASH_CR).</p> <p>CRYP: deeply revisited section.</p> <p>TIM1/TIM8 Updated Figure 379: Control circuit in external clock mode 2. Updated Figure 381: Capture/compare channel 1 main circuit. Updated Section 40.3.26: Timer synchronization. Added Note in Section 40.4.1: TIMx control register 1 (TIMx_CR1)(x = 1, 8). Updated Section 40.4.8: TIMx capture/compare mode register 1 [alternate] (TIMx_CCMR1)(x = 1, 8). Updated Table 293: Output control bits for complementary OCx and OCxN channels with break feature. Updated Section 40.4.26: TIM1 alternate function option register 1 (TIM1_AF1). Updated Section 40.4.27: TIM1 Alternate function register 2 (TIM1_AF2). Updated Section 40.4.28: TIM8 Alternate function option register 1 (TIM8_AF1). Updated Section 40.4.29: TIM8 Alternate function option register 2 (TIM8_AF2).</p> <p>TIM2/TIM3/TIM4/TIM5: Updated Figure 412: General-purpose timer block diagram. Updated Figure 436: Control circuit in external clock mode 2. Updated Figure 438: Capture/Compare channel 1 main circuit. Updated Figure 439: Output stage of Capture/Compare channel (channel 1). Updated Section 41.3.19: Timer synchronization. Updated Figure 456: Master/slave connection example with 1 channel only timers. Updated Section 41.4.8: TIMx capture/compare mode register 1 [alternate] (TIMx_CCMR1) (x = 2 to 5). Updated Section 41.4.11: TIMx capture/compare enable register (TIMx_CCER)(x = 2 to 5).</p>

Table 609. Document revision history (continued)

Date	Revision	Changes
15-Jan-2021	5 (continued)	<p>TIM12/TIM13/TIM14: Updated Figure 463: General-purpose timer block diagram (TIM13/TIM14). Updated Figure 476: Capture/compare channel 1 main circuit. Updated Figure 477: Output stage of capture/compare channel (channel 1). Added Section 42.3.18: Using timer output as trigger for other timers (TIM13/TIM14). Updated Section 42.4.8: TIM12 capture/compare mode register 1 [alternate] (TIM12_CCMR1). Updated Section 42.4.9: TIM12 capture/compare enable register (TIM12_CCER). Updated Section 42.5.6: TIMx capture/compare mode register 1 [alternate] (TIMx_CCMR1)(x = 13 to 14). Updated Section 42.5.7: TIMx capture/compare enable register (TIMx_CCER)(x = 13 to 14).</p> <p>TIM15/TIM16/TIM17: Updated Figure 489: TIM16/TIM17 block diagram. Updated Figure 503: Capture/compare channel 1 main circuit. Updated Figure 504: Output stage of capture/compare channel (channel 1). Updated Figure 505: Output stage of capture/compare channel (channel 2 for TIM15). Added Section 43.4.24: Using timer output as trigger for other timers (TIM16/TIM17). Updated Section 43.5.8: TIM15 capture/compare mode register 1 [alternate] (TIM15_CCMR1). Updated Table 307: Output control bits for complementary OCx and OCxN channels with break feature (TIM15). Updated Section 43.6.7: TIMx capture/compare mode register 1 [alternate] (TIMx_CCMR1) (x = 16 to 17). Updated Table 309: Output control bits for complementary OCx and OCxN channels with break feature (TIM16/17).</p> <p>LPTIM: Updated Section 45.3: LPTIM implementation. Updated Table 312: STM32MP157 LPTIM features. Updated Section 45.4.4: LPTIM reset and clocks. Updated Table 327: Effect of low-power modes on the LPTIM.</p> <p>STGEN: Updated Section 46.4.2: STGENC status register (STGENC_CNTSR).</p>

Table 609. Document revision history (continued)

Date	Revision	Changes
15-Jan-2021	5 (continued)	<p>USART: Added Section 53.6: USART in low-power modes. Updated Section 53.7: USART interrupts. Updated Table 382: USART interrupt requests. Updated Section 53.8.7: USART receiver timeout register (USART_RTOR). Updated Section 53.8.8: USART request register (USART_RQR). Updated Section 53.8.9: USART interrupt and status register (USART_ISR). Updated Section 53.8.10: USART interrupt and status register [alternate] (USART_ISR).</p> <p>SPI: deeply revisited section.</p> <p>SPDIF: Added Note in Section 56.2: SPDIFRX main features. Added Note in Table 408: Minimum spdifrx_ker_ck frequency versus audio sampling rate.</p> <p>SDMMC: Updated Section : Data path. Moved Section 58.7: Hardware flow control. Updated Section 58.10.2: SDMMC clock control register (SDMMC_CLKCR). Updated Section 58.10.18: SDMMC IDMA buffer base address register (SDMMC_IDMABASER).</p> <p>OTG: Updated Section 60.4.3: OTG core. Updated Section 60.4.4: Embedded full-speed OTG PHY connected to OTG. Updated Section 60.4.5: OTG detections. Added Figure 739: OTG peripheral-only connection. Added Figure 740: OTG host-only connection. Updated Section 60.14.4: OTG USB configuration register (OTG_GUSBCFG). Updated Section 60.14.15: OTG general core configuration register (OTG_GCCFG). Updated Section 60.14.29: OTG host channel x characteristics register (OTG_HCCHARx). Updated Section : Halting a channel.</p> <p>ETH: deeply revisited section.</p> <p>DEBUG: Updated Section 66.8: Serial wire and JTAG debug port (SWJ-DP). Updated Table 577: MEM-AP registers. Updated Section : AP1 control/status word register (AP1_CSW). Updated Section : DBGMCU identity code register (DBGMCU_IDC).</p>

Table 609. Document revision history (continued)

Date	Revision	Changes
15-Jan-2021	5 (continued)	<p>Updated Section : CM4ROM memory type register (CM4ROM_MEMTYPE). Updated Section : CM4ROM CoreSight peripheral identity register 4 (CM4ROM_PIDR4). Updated Section : CM4ROM CoreSight peripheral identity register 0 (CM4ROM_PIDR0). Updated Section : CM4ROM CoreSight peripheral identity register 1 (CM4ROM_PIDR1). Updated Section : CM4ROM CoreSight peripheral identity register 2 (CM4ROM_PIDR2). Device electronic signature: Section 67.2: Device part number (RPN).</p>
28-Apr-2022	6	<p>BSEC: Updated Section 3.2: BSEC main features. Updated Section 3.3.2: Interface to OTP. Updated Section 3.3.3: OTP security modes including Table 11: OTP modes definition.. Updated Section 3.3.6: OTP operations. Updated Section 3.6.2: BSEC OTP control register (BSEC_OTP_CONTROL). Updated Section 3.6.9: BSEC OTP lock status register x (BSEC_OTP_WRLOCKEDx). OTP: Updated Table 17: OTP list words 0 to 31. Updated Table 18: OTP list words 32 to 95. DDRPHYC: Updated Section 7.1: DDRPHYC features. Updated Table 22: DDRPHYC I/O list. Updated Section 7.5.1: PHY and SDRAM initialization. Updated Section 7.5.7: Read valid training (RVTRN). Updated Section 7.7.2: DDRPHYC PHY initialization register (DDRPHYC_PIR). Updated Section 7.7.3: DDRPHYC PHY global control register (DDRPHYC_PGCR). Updated Section 7.7.4: DDRPHYC PHY global status register (DDRPHYC_PGSR). Updated Section 7.7.5: DDRPHYC DDR DLL global control register (DDRPHYC_DLLGCR). Updated Section 7.7.38: DDRPHYC byte lane n DLLC register (DDRPHYC_DXnDLLCR). PWR: Updated Section 9.3.1: PWR core domain. Updated Table 34: Functionalities depending on system operating mode footnote. Updated Section 9.6.9: PWR LP-Stop and LPLV-Stop modes.</p>

Table 609. Document revision history (continued)

Date	Revision	Changes
28-Apr-2022	6 (continued)	<p>RCC: Updated Figure 89: Clock distribution for RTC.</p> <p>HSEM: Updated Section 11.4: HSEM registers introduction.</p> <p>IPCC: Updated Figure 114: IPCC Simplex - Send procedure state diagram.</p> <p>ETZPC: Updated reset value in Section 15.7.6: ETZPC IP version register (ETZPC_VERR).</p> <p>MDMA: Updated Section 17.5.7: MDMA channel x transfer configuration register (MDMA_CxTCR). Updated Section 17.5.9: MDMA channel x source address register (MDMA_CxSAR). Updated Section 17.5.10: MDMA channel x destination address register (MDMA_CxDAR). Updated Section 17.5.13: MDMA channel x trigger and bus selection register (MDMA_CxTBR).</p> <p>DMA: Updated Section 18.5.5: DMA stream x configuration register (DMA_SxCR).</p> <p>DMAMUX: Updated Section 19.4.4: DMAMUX request line multiplexer. Updated Section 19.4.5: DMAMUX request generator.</p> <p>CRC: Updated Section 25.2: CRC main features. Updated Figure 144: CRC calculation unit block diagram. Updated Section 25.3.3: CRC operation. Updated Section 25.4: CRC registers introduction. Added Section 25.4.6: CRC hardware configuration register (CRC_HWCFGR) to Section 25.4.9: CRC size identification register (CRC_SIDR).</p> <p>FMC: Updated entire section</p> <p>QUADSPI: Updated Section 27.1: Introduction. Updated Section 27.2: QUADSPI main features. Updated Figure 171: QUADSPI block diagram. Updated Section : Address phase. Updated Section : Data phase. Updated Section : FIFO and data management. Updated Section 27.3.6: QUADSPI automatic status-polling mode. Updated Section : Automatic status-polling mode.</p>

Table 609. Document revision history (continued)

Date	Revision	Changes
28-Apr-2022	6 (continued)	<p>ADC: Updated Section : Constraints between ADC clocks. Updated Section : DMA one shot mode (DMNGT=01). Updated Figure 219: AUTDLY=1 in auto- injected mode (JAUTO=1). Updated Figure 213: Example of overrun (OVRMOD = 0). Updated Figure 228: Regular and injected oversampling modes used simultaneously. Updated Figure 229: Triggered regular oversampling with injection. Updated Section : Regular simultaneous mode with independent injected. Updated Section : Reading the temperature.</p> <p>DTS: Updated Figure 251: Temperature sensor functional block diagram. Updated Table 205: Trigger configuration. Updated Table 30.6.4: Temperature sensor interrupt threshold register 1 (DTS_ITR1).</p> <p>DAC: Updated Section 31.2: DAC main features.</p> <p>VREFBUF: Updated Section 32.2: VREFBUF functional description. Updated Section Table 218.: VREF buffer modes.</p> <p>DSI: Added Section 36.12.2: D-PHY HS2LP and LP2HS durations.</p> <p>RNG: Updated Section 37.2: RNG main features. Updated Section 37.7.3: RNG data register (RNG_DR).</p> <p>HASH: Updated Section 38.4.7: HMAC operation. Added Note in Section 38.4.5: Message digest computing.</p> <p>CRYP: Updated Section 39.3: CRYP implementation. Updated Section 39.4.7: Preparing the CRYP AES key for decryption. Updated Section 39.7.8: CRYP masked interrupt status register (CRYP_MISR).</p> <p>TIM1/TIM8: Updated Figure 375: Control circuit in normal mode, internal clock divided by 1. Updated Section 40.3.16: Using the break function. Updated Section 40.4.8: TIMx capture/compare mode register 1 [alternate] (TIMx_CCMR1)(x = 1, 8).</p>

Table 609. Document revision history (continued)

Date	Revision	Changes
28-Apr-2022	6 (continued)	<p>TIM2/TIM3/TIM4/TIM5: Updated Section 41.4.8: TIMx capture/compare mode register 1 [alternate] (TIMx_CCMR1) (x = 2 to 5). Updated Section 41.4.11: TIMx capture/compare enable register (TIMx_CCER)(x = 2 to 5).</p> <p>TIM12/TIM13/TIM14: Updated Figure 472: Control circuit in normal mode, internal clock divided by 1. Updated Section 42.4.7: TIM12 capture/compare mode register 1 [alternate] (TIM12_CCMR1). Updated Section 42.5.6: TIMx capture/compare mode register 1 [alternate] (TIMx_CCMR1)(x = 13 to 14).</p> <p>TIM15/TIM16/TIM17: Updated Figure 499: Control circuit in normal mode, internal clock divided by 1. Updated Section 43.4.13: Using the break function. Added Section 43.4.15: 6-step PWM generation. Updated Section 43.5.4: TIM15 DMA/interrupt enable register (TIM15_DIER). Updated Section 43.5.8: TIM15 capture/compare mode register 1 [alternate] (TIM15_CCMR1). Updated Table 307: Output control bits for complementary OCx and OCxN channels with break feature (TIM15). Updated Section 43.5.16: TIM15 break and dead-time register (TIM15_BDTR). Updated Section 43.6.7: TIMx capture/compare mode register 1 [alternate] (TIMx_CCMR1) (x = 16 to 17). Updated Table 309: Output control bits for complementary OCx and OCxN channels with break feature (TIM16/17). Updated Section 43.6.14: TIMx break and dead-time register (TIMx_BDTR)(x = 16 to 17).</p> <p>LPTIM: Updated Section 45.2: LPTIM main features. Updated Section 45.4.4: LPTIM reset and clocks. Updated Section 45.4.7: Trigger multiplexer. Updated Section 45.4.15: Encoder mode. Updated Section 45.7.1: LPTIM interrupt and status register (LPTIM_ISR). Updated Section 45.7.4: LPTIM configuration register (LPTIM_CFGR). Updated Section 45.7.5: LPTIM control register (LPTIM_CR).</p> <p>IWDG: Updated Figure 544: Independent watchdog block diagram. Updated Section 48.4.4: Window option.</p>

Table 609. Document revision history (continued)

Date	Revision	Changes
28-Apr-2022	6 (continued)	<p>Updated Figure 546: Reset timing due to refresh in the not allowed area.</p> <p>Updated Section 48.5: IWDG low-power modes.</p> <p>Updated Section 48.6: IWDG interrupts.</p> <p>Updated Section 48.7.1: IWDG key register (IWDG_KR).</p> <p>Updated Section 48.7.7: IWDG hardware configuration register (IWDG_HWCFGR).</p> <p>WWDG:</p> <p>Removed WWDG hardware configuration register (WWDG_HWCFGR).</p> <p>RTC:</p> <p>Updated Section 50.3.14: RTC smooth digital calibration.</p> <p>Updated Section 50.6.22: RTC status clear register (RTC_SCR).</p> <p>TAMP:</p> <p>Updated Section 51.6.1: TAMP control register 1 (TAMP_CR1).</p> <p>USART/UART:</p> <p>Updated Section 53.5.21: USART low-power management.</p> <p>Updated Section 53.8.3: USART control register 2 (USART_CR2).</p> <p>Updated Section 53.8.9: USART interrupt and status register (USART_ISR).</p> <p>Updated Section 53.8.10: USART interrupt and status register [alternate] (USART_ISR).</p> <p>SAI:</p> <p>Updated Section 55.4.10: PDM interface.</p> <p>Updated Table 399: TDM frame configuration examples.</p> <p>Updated Section 55.6.19: SAI PDM delay register (SAI_PDMDLY).</p> <p>SPDIF:</p> <p>Updated Figure 667: SPDIFRX block diagram.</p> <p>Updated Table 406: SPDIFRX pins.</p> <p>Updated Figure 672: SPDIFRX decoder.</p> <p>Added Table 409: Conditions of spdifrx_symb_ck generation.</p> <p>MDIOS:</p> <p>Updated Section 57.3.4: MDIOS data.</p> <p>Updated Section 57.3.5: MDIOS APB frequency.</p> <p>Updated Section 57.3.6: Write/read flags and interrupts.</p> <p>Updated Section 57.3.7: MDIOS error management.</p> <p>Updated Section 57.4.1: MDIOS configuration register (MDIOS_CR).</p> <p>Updated Section 57.4.6: MDIOS status register (MDIOS_SR).</p>

Table 609. Document revision history (continued)

Date	Revision	Changes
28-Apr-2022	6 (continued)	<p>Updated Section 57.4.7: MDIOS clear flag register (MDIOS_CLRFR).</p> <p>SDMMC: Updated Section : Data FIFO. Updated Section : Stream operation and CMD12. Updated Section : Normal boot operation. Updated Section : Alternative boot operation.</p> <p>FDCAN: Added Table 442: CAN triggers. Updated Section 59.4.6: Application.</p> <p>OTG: Updated Table 60.14.17: OTG core LPM configuration register (OTG_GLPMCFG).</p> <p>CEC: Updated Table 63.7: HDMI-CEC registers introduction.</p> <p>ETH: Updated all Section 64: Ethernet (ETH): gigabit media access control (GMAC) with DMA controller.</p> <p>DEBUG: Replaced nJTRST by NJTRST.</p>

IMPORTANT NOTICE – READ CAREFULLY

STMicroelectronics NV and its subsidiaries (“ST”) reserve the right to make changes, corrections, enhancements, modifications, and improvements to ST products and/or to this document at any time without notice. Purchasers should obtain the latest relevant information on ST products before placing orders. ST products are sold pursuant to ST’s terms and conditions of sale in place at the time of order acknowledgment.

Purchasers are solely responsible for the choice, selection, and use of ST products and ST assumes no liability for application assistance or the design of purchasers’ products.

No license, express or implied, to any intellectual property right is granted by ST herein.

Resale of ST products with provisions different from the information set forth herein shall void any warranty granted by ST for such product.

ST and the ST logo are trademarks of ST. For additional information about ST trademarks, refer to www.st.com/trademarks. All other product or service names are the property of their respective owners.

Information in this document supersedes and replaces information previously supplied in any prior versions of this document.
